Abstract

Being an artist represents a lifelong commitment to nonstop development, despite life circumstances. I fully utilized my two years at graduate school to develop a sustainable way of living an artist's life by creating a standard operating procedure (SOP), guiding my research and practice. An SOP is a strategic method designed to reach an objective in a systemic manner. Mine shows it is possible for an artist to stay productive, creative, and healthy under high pressure, even during unexpected contingencies like the COVID-19 pandemic. My personal experience completing graduate school during a pandemic presents a possibility to other artists of how to live an artist's life effectively and healthily. It could show the possibility of art practice to enhance and give meaning to life.

I decided to construct my thesis in mission log format. Every ten weeks, I conducted a post-analysis of my art practice. These two pieces are woven together to give a clear depiction of my art practice, both from a micro-scale and grand perspective. The log truthfully recounts events at specific moments during my research. The third-person perspective of analysis helps to portray meaning, reasons, and reflections more objectively and critically.

C1

At the beginning, I prepared myself for the long run, the unknown, and the worst case. I developed a weekly routine that included physical exercise, creativity training, self-analysis, and research involving the relationship between my art practice and the broader social context around me, to push the quality and quantity of my work. I rigorously followed my routine continuously for two years, even during COVID-19 lockdowns. I refined my art practice method into an SOP to help move forward and face future challenges with confidence. The SOP I developed in graduate school sets up the foundation for my future art practice and gives me the ability to build new SOP scenarios.

C2

Introduction

By the time someone reads this, I will no longer be here, and the mission will have ended.

I am the operator for the mission codenamed *Otter*. Tag name, *H*. I specialize in maritime activities and conduct technological research under demands of intense physical and social survival conditions. This file is my declassified mission logbook from mid-2019 to mid-2021 at KBAB, RI. It documents how I developed my survival method by establishing an SOP to combat the pressure of operation HQ, my personal conditions and abilities, and the global pandemic crisis.

If someone digs this far to read my log, I suppose they are facing challenges, just like I did. Hopefully, this logbook can be an inspiration for them to move forward. Lives are a one-way mission, same for everybody :)

H used his two years of deployment in Rhode Island to explore how to maintain his personal wellness and high mission performance at the same time. He needed to make sure both objectives could be achieved despite contingencies and out-of-bound mission pressure, like the COVID-19 impact and reform at headquarters. The standard operating procedure he developed for accomplishing the mission was not only effective for *Otter* but could be transformed for future missions to

C3

ensure the sustainability of post-mission life. For future operator, though they will not conduct the same mission in terms of subject matter, the framework of H's SOP can be referenced to achieve objectives.

C4

Declassified Mission Log Part 1

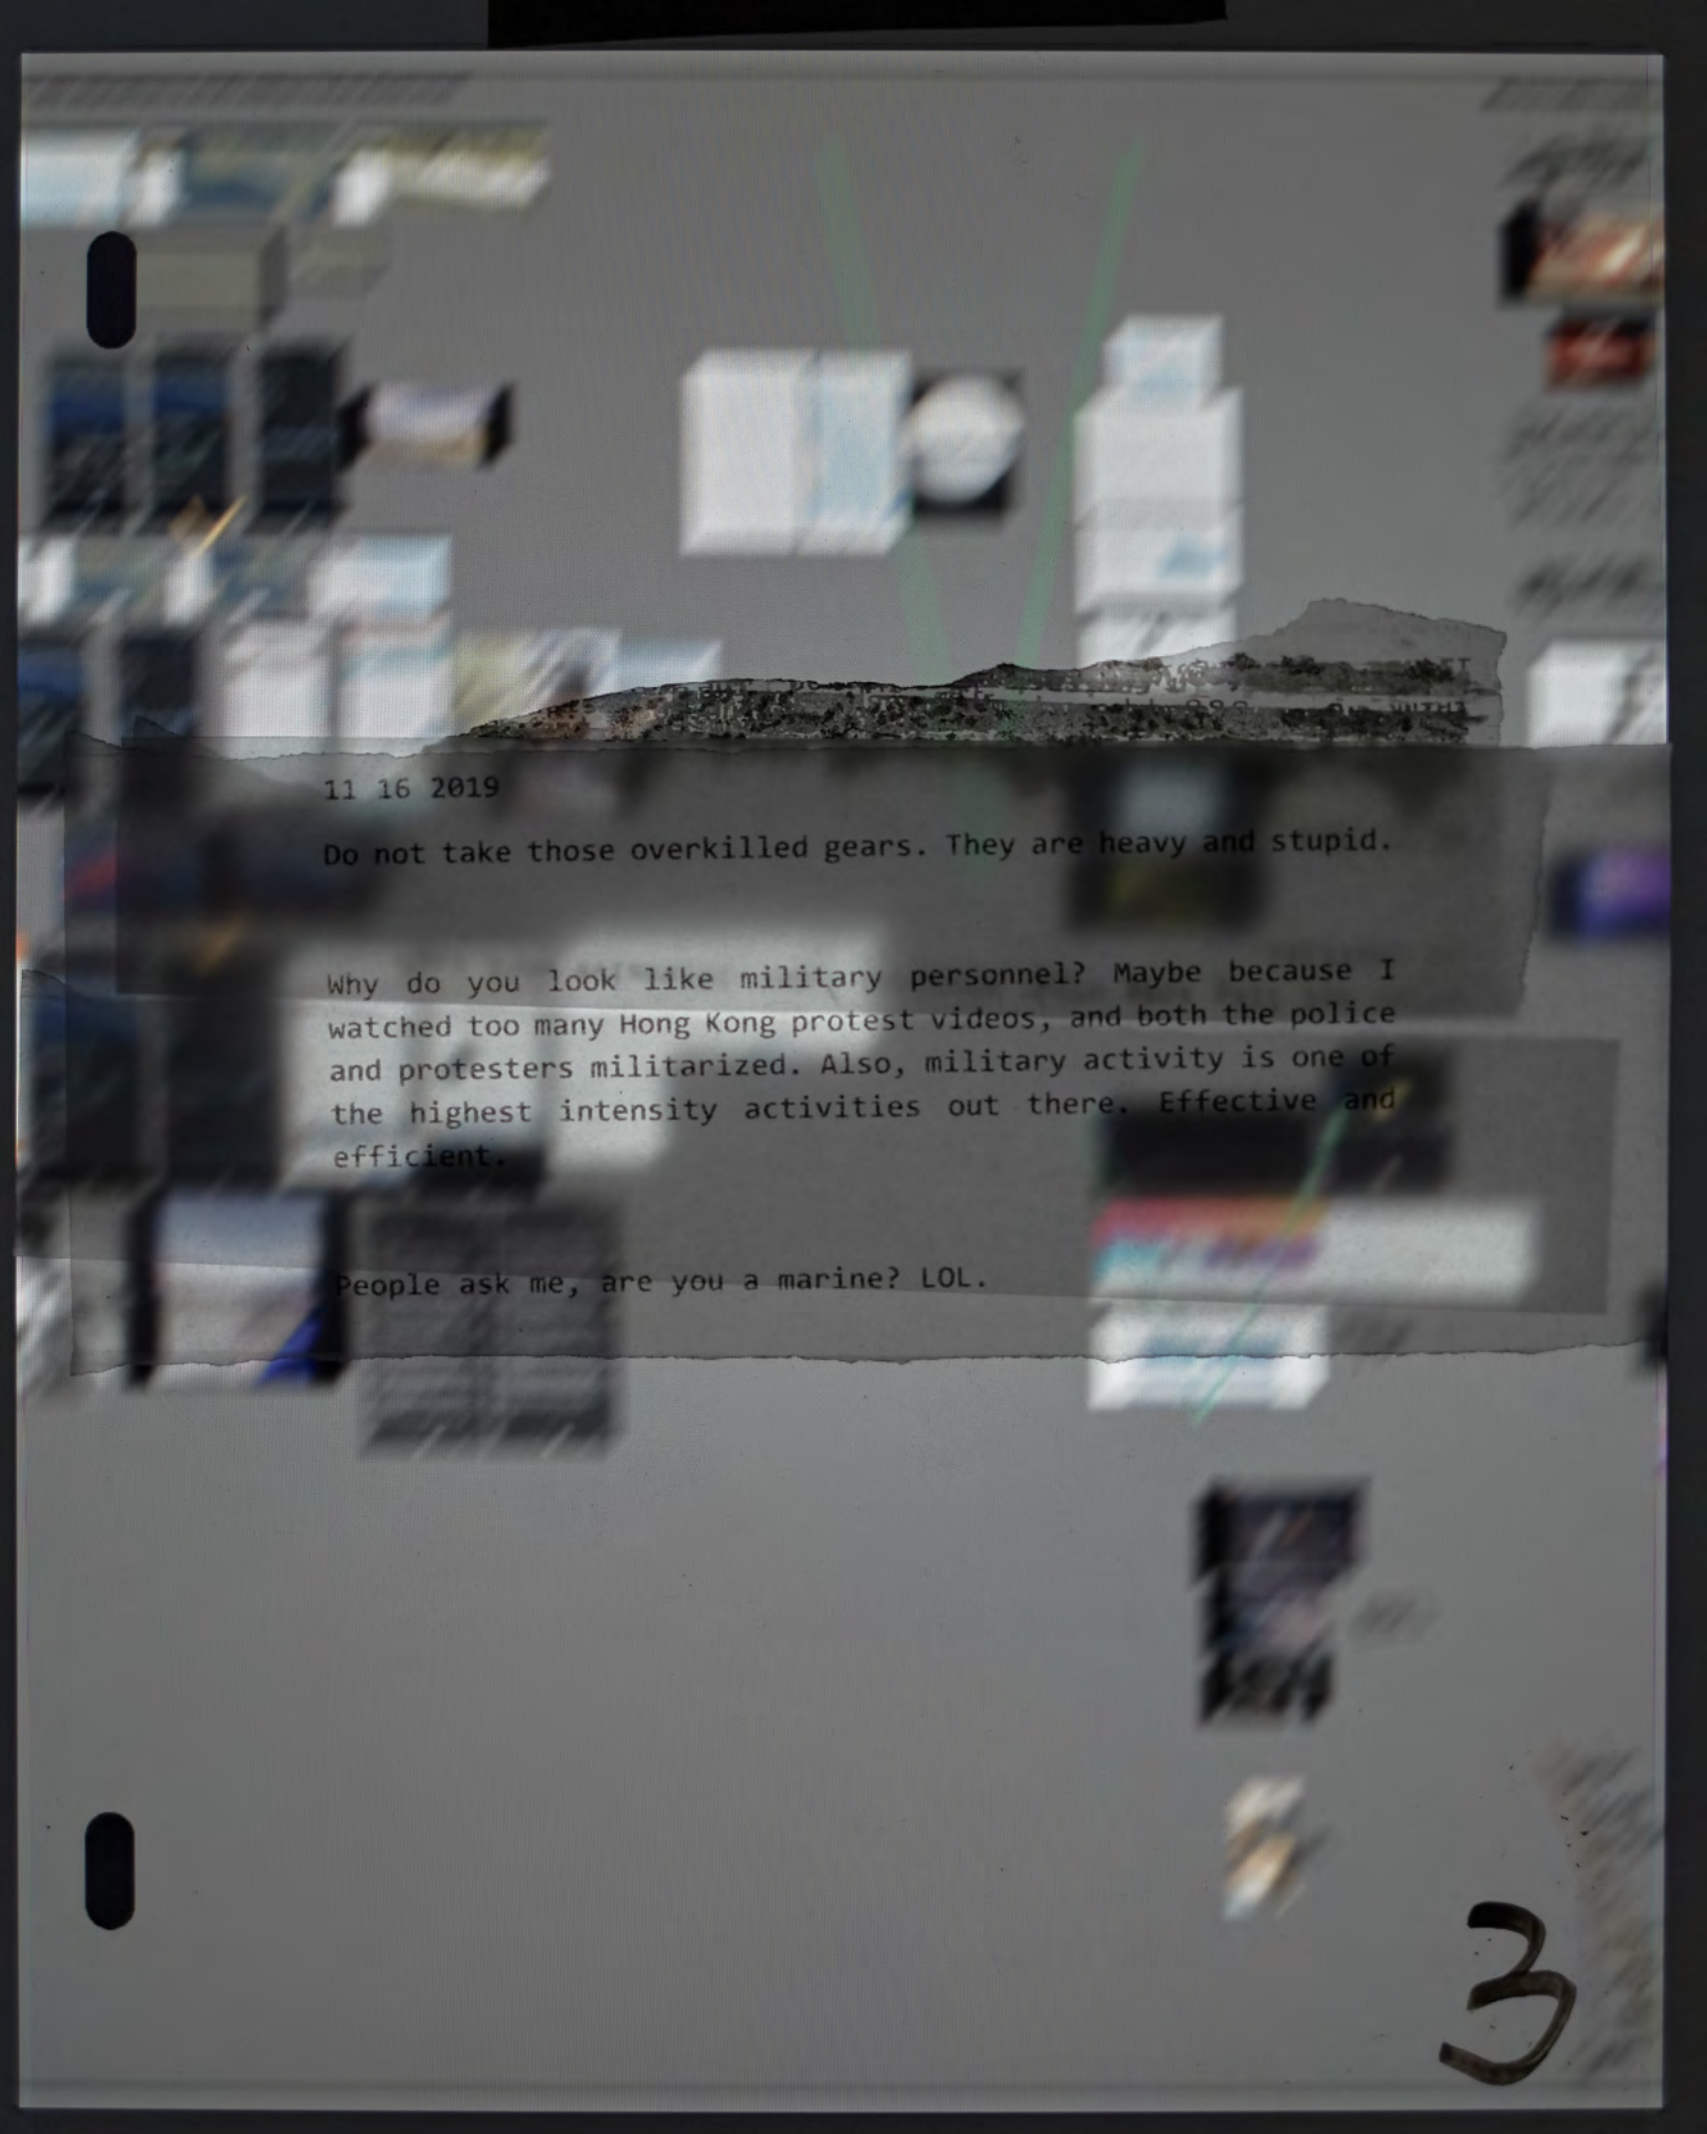
11 02 2019

It is like a celebration, an escape from reality. It feels more real than real.

11 10 2019

I have so many things to do at the same time. I am worried about my class assignments.

The sound wave from the water mic seems to match my activity.



11 16 2019

Do not take those overkilled gears. They are heavy and stupid.

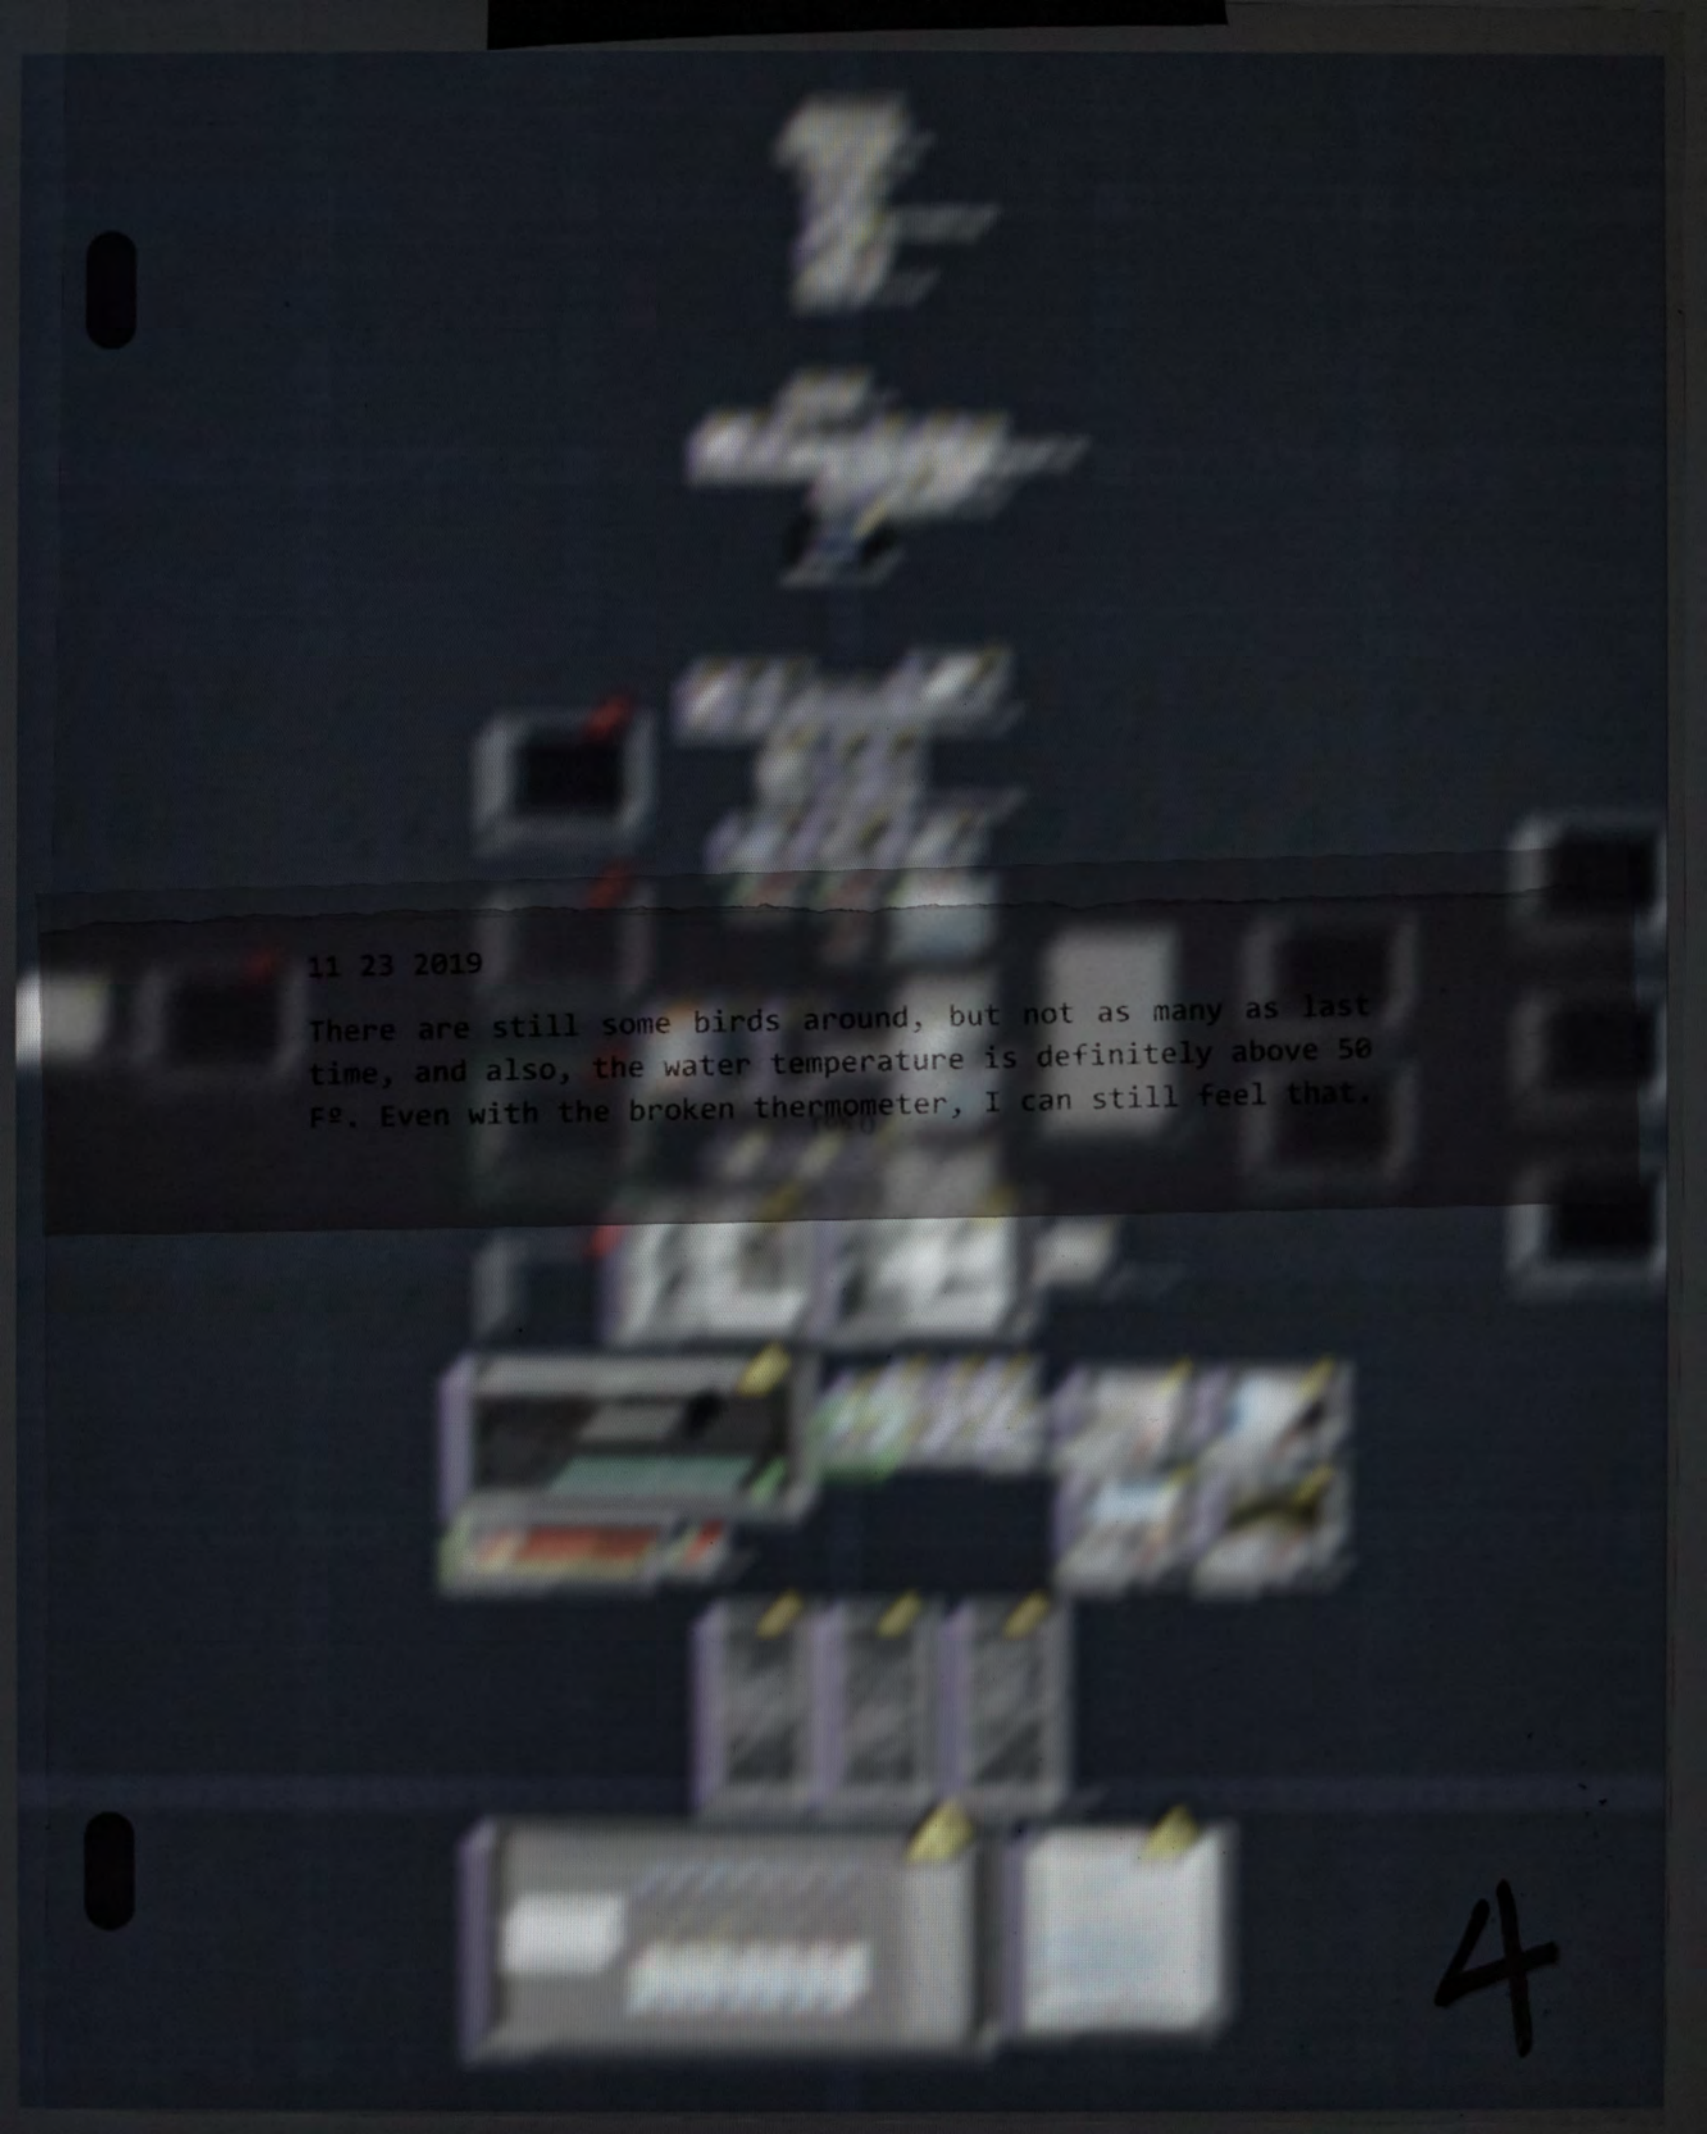
Why do you look like military personnel? Maybe because I watched too many Hong Kong protest videos, and both the police and protesters militarized. Also, military activity is one of the highest intensity activities out there. Effective and efficient.

People ask me, are you a marine? LOL.

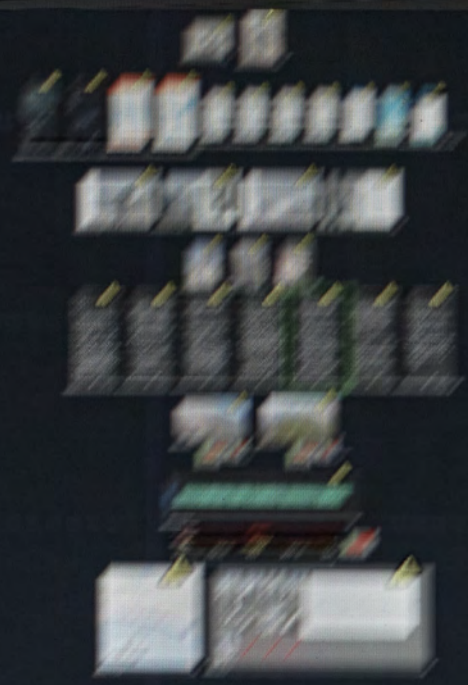
3

11 23 2019

There are still some birds around, but not as many as last time, and also, the water temperature is definitely above 50 Fº. Even with the broken thermometer, I can still feel that.



4

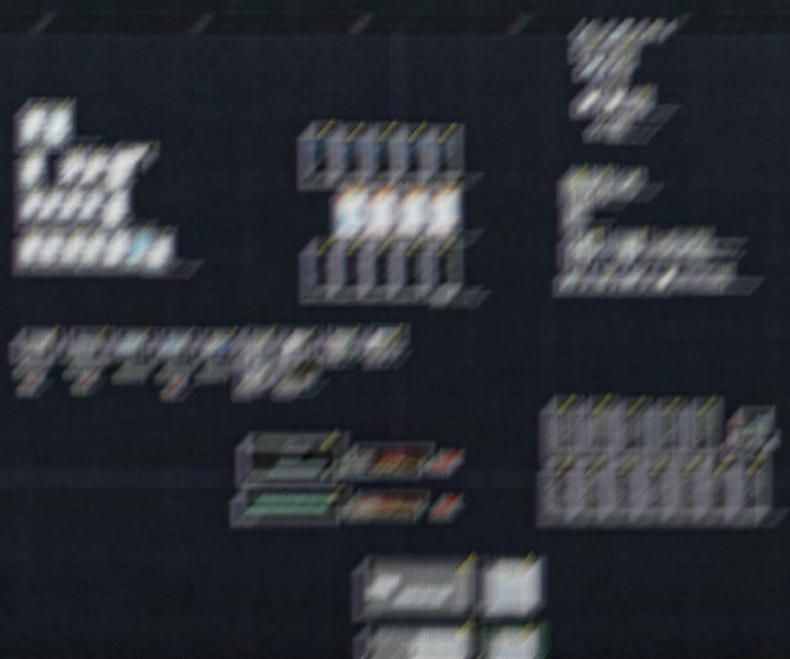


11 30 2019

Everything is a trade. I got the ability to get in the cold water with the wetsuit, but I lost the comfort of moving my arms around freely.

There are not many people on the beach. It is very quiet.

Right now, I feel unstoppable. It is the first time in many weeks the water temperature is no longer a problem. I can focus on what is actually happening here instead of battling with the temperature.



12 07 2019

I used to finish one thing and then come back to show people what I did. Now, I take people with me along the way.

92% of Afghan men in Helmand and other Afghan provinces do not know what 9/11 is. It is just like the current art world.[1]

The difference between 0 and 1 matters more than the difference between 1 and 100. By exploring new things, I will turn my zeros into ones. I am not trying to turn ones into 100s now.

The law of diminishing marginal utility;[2] my time here is limited, so I need to use the time to improve my weakness. I believe it will be beneficial.

Marginal cost. It is not cost-effective to keep pushing my making in familiar areas because every little bit of progress requires more time and more money, but the payoff is decreasing.

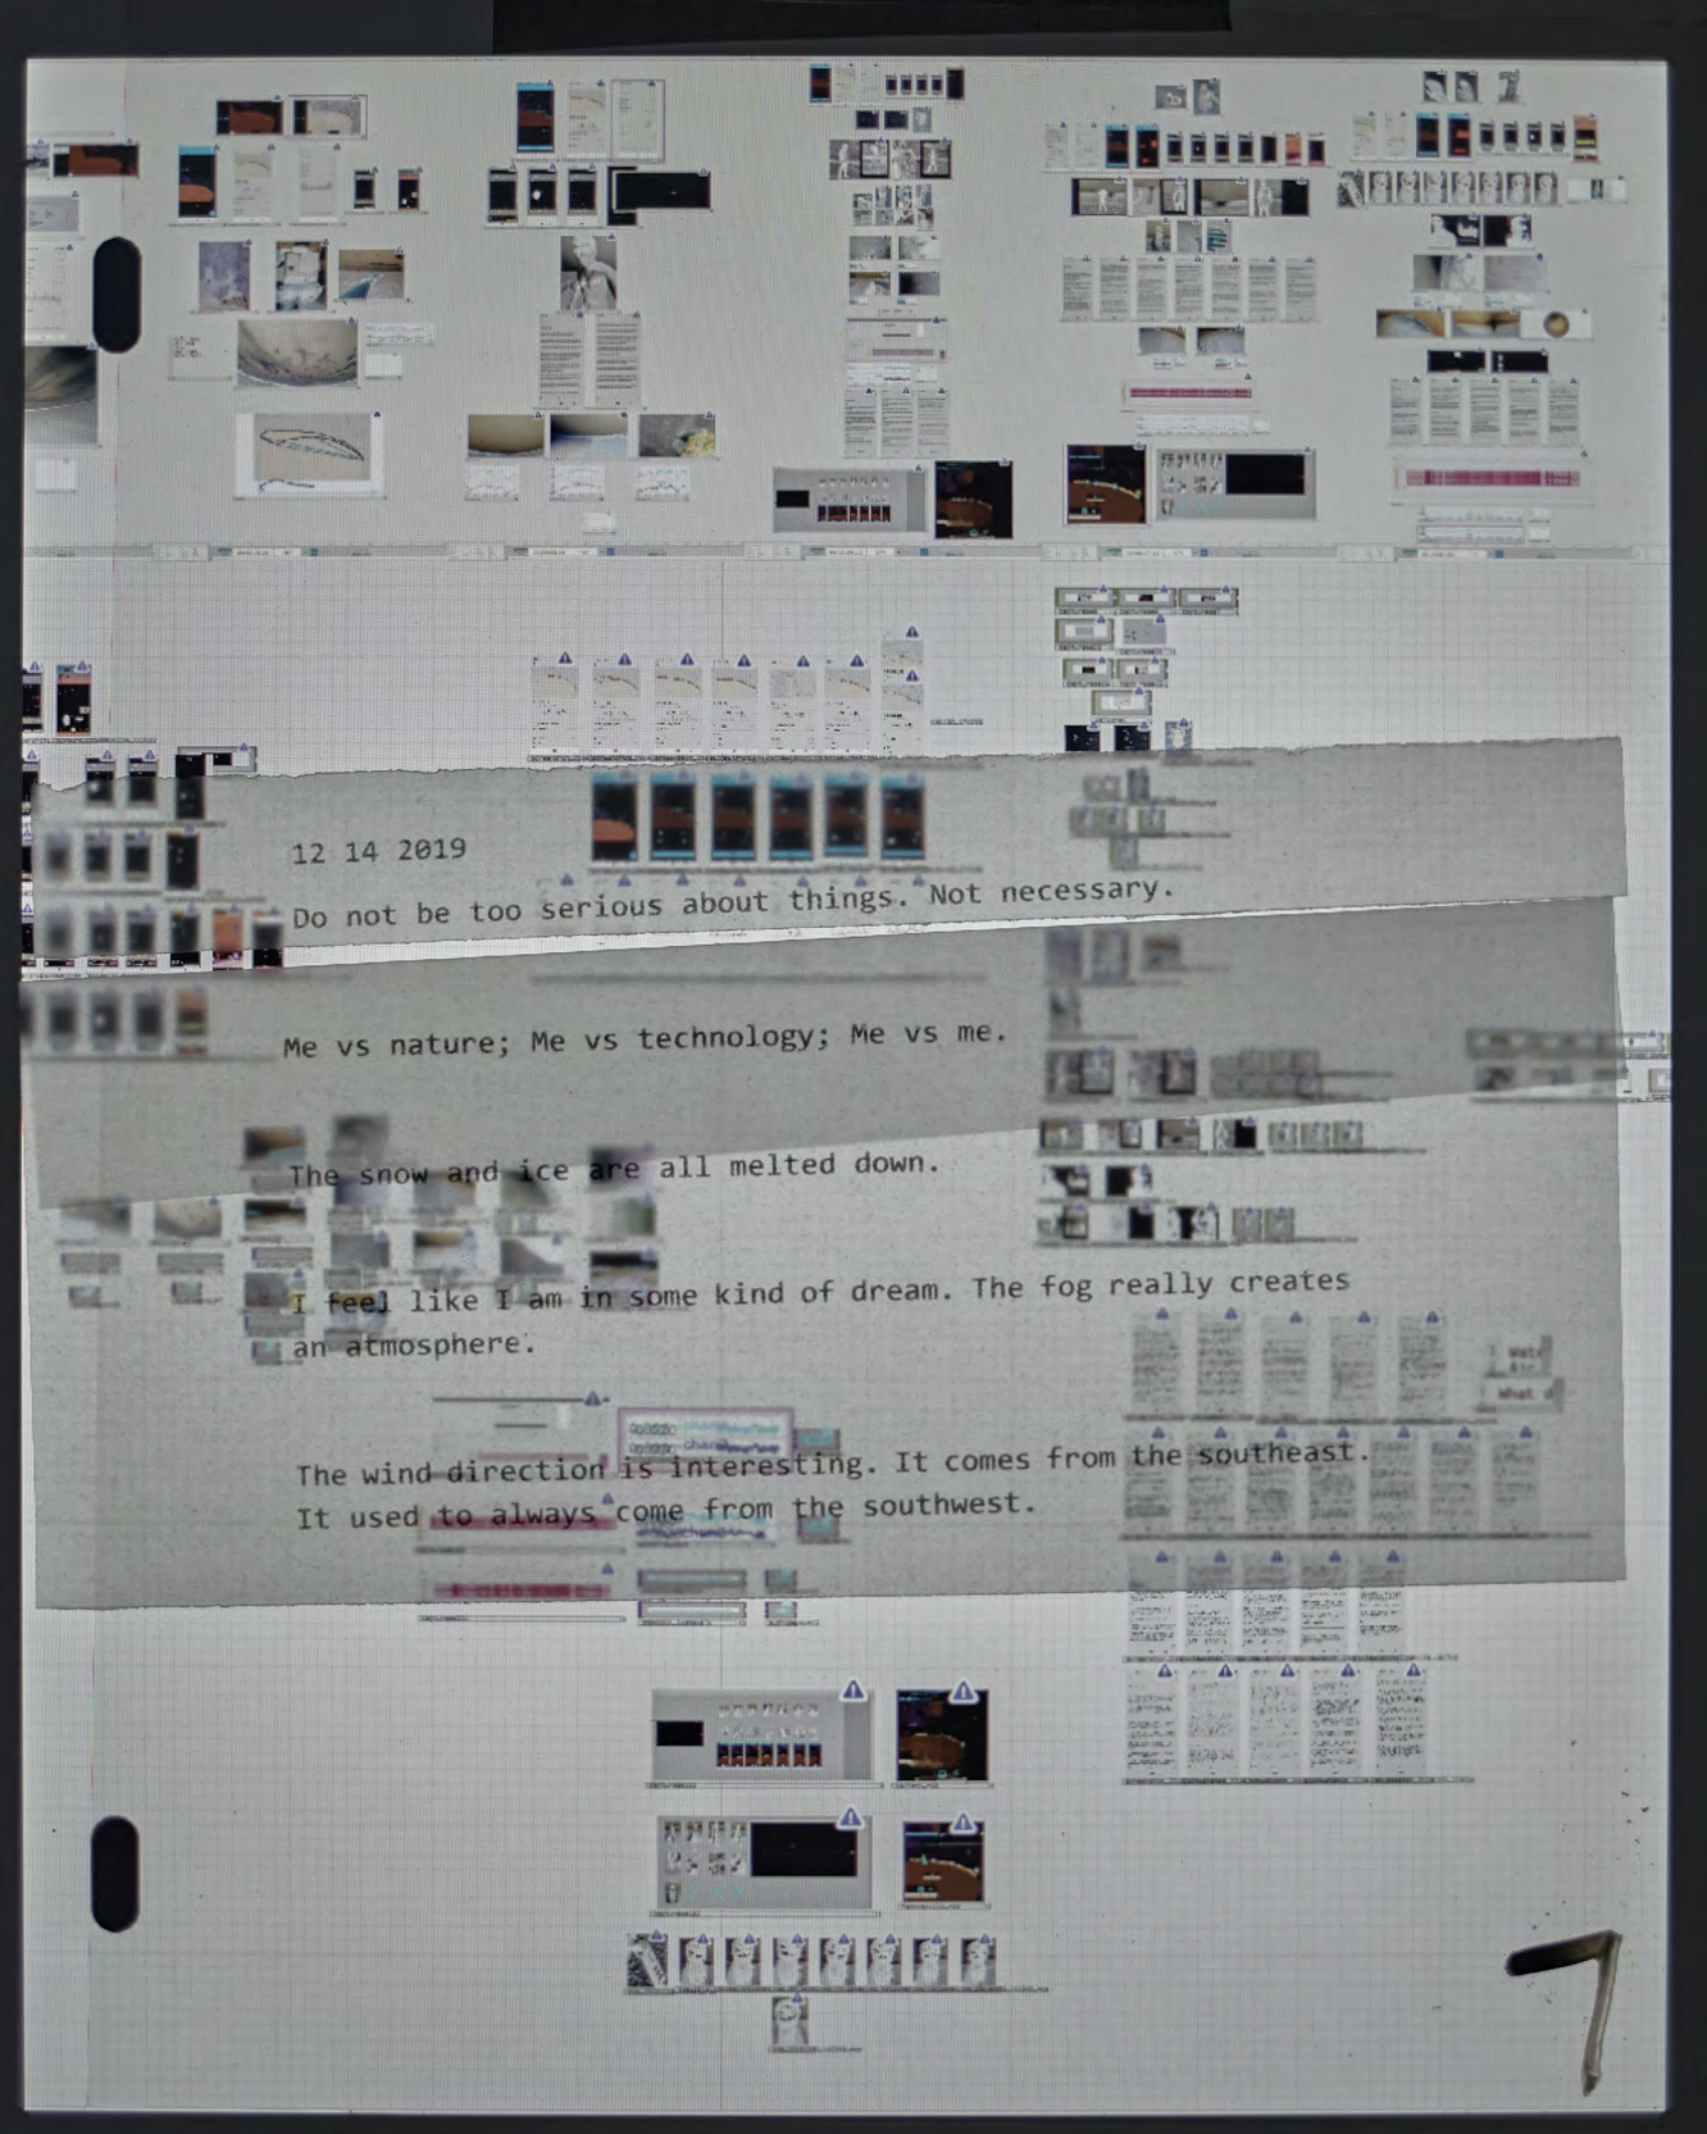
This time I decided to put my GoPro on my right arm because I walk from West to East in the water. If I put it on my right arm, it can film the ocean side more

I could not record underwater sound using the hydrophone, because I could not make sure my recorder would stay dry. I should come up with a waterproof solution for the recorder.

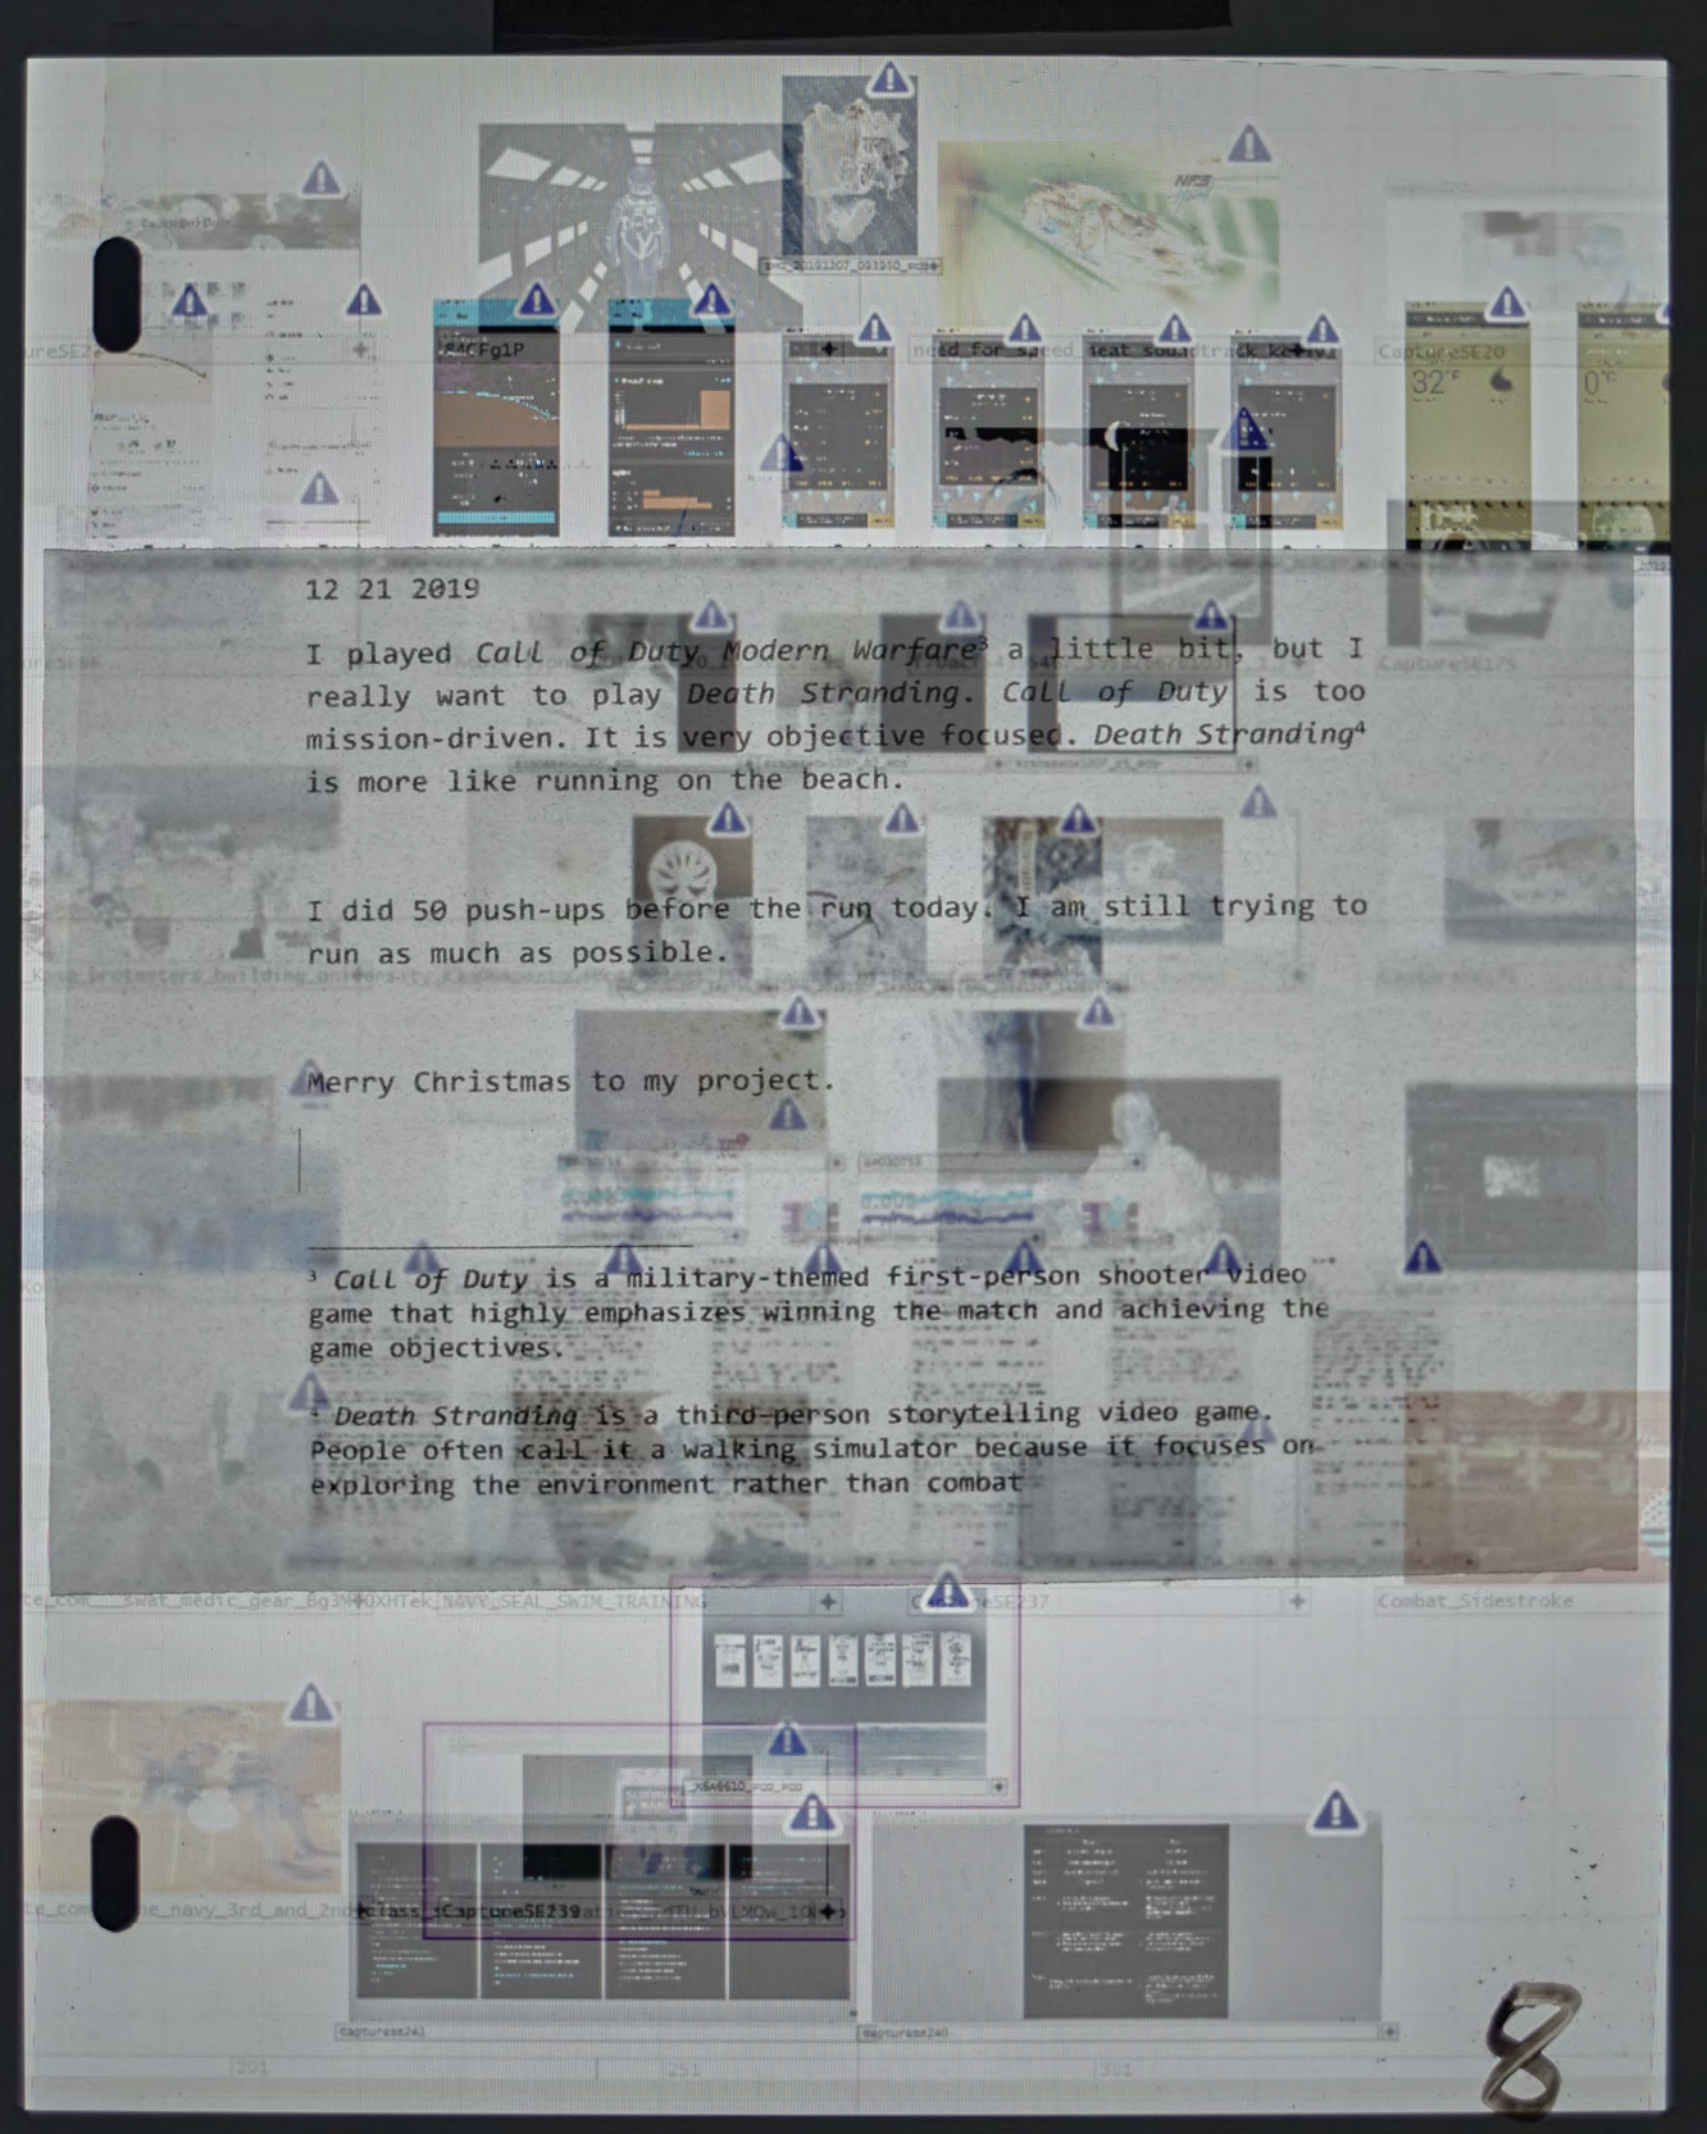
I had many genius moments in past art practice. However, I did not document those moments well. A lot of cool ideas got lost over time. I need to find a way to capture and save those moments.

[1] Adam Pletts, "What Does 9/11 Mean to People in Afghanistan?" PBS NewsHour, September 12, 2011, video, 6:50, https://youtu.be/SimIS_cQ6ko.

[2] Justin Helps, "Simulating Supply and Demand" Primer, April 27, 2019, video, 12:21, https://youtu.be/PNtKXWNKGN8.



12 14 2019
Do not be too serious about things. Not necessary.
Me vs nature; Me vs technology; Me vs me.
The snow and ice are all melted down.
I feel like I am in some kind of dream. The fog really creates an atmosphere.
The wind direction is interesting. It comes from the southeast. It used to always come from the southwest.



12 21 2019

I played *Call of Duty Modern Warfare*[3] a little bit, but I really want to play *Death Stranding*. *Call of Duty* is too mission-driven. It is very objective focused. *Death Stranding*[4] is more like running on the beach.

I did 50 push-ups before the run today. I am still trying to run as much as possible.

Merry Christmas to my project.

---

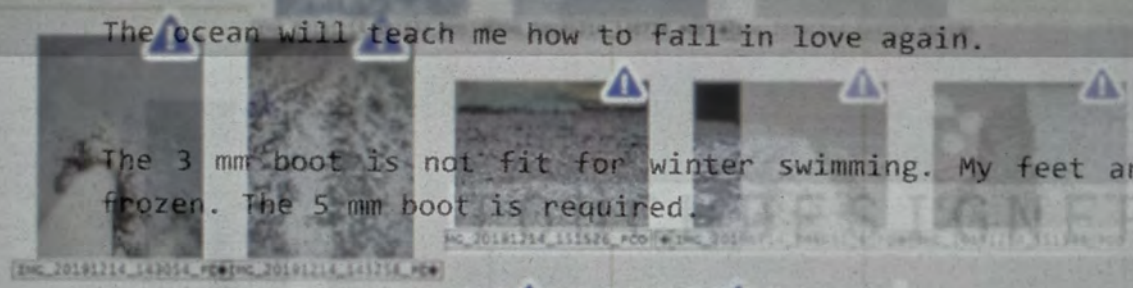
[3] *Call of Duty* is a military-themed first-person shooter video game that highly emphasizes winning the match and achieving the game objectives.

[4] *Death Stranding* is a third-person storytelling video game. People often call it a walking simulator because it focuses on exploring the environment rather than combat

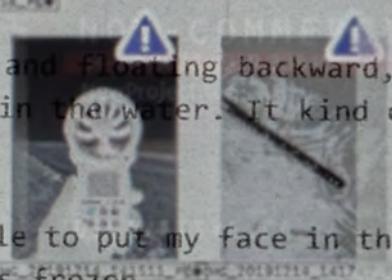
12 28 2019

If you want to say something, but no one wants to hear. Just stand in front of the sea and talk to the sea.

The ocean will teach me how to fall in love again.

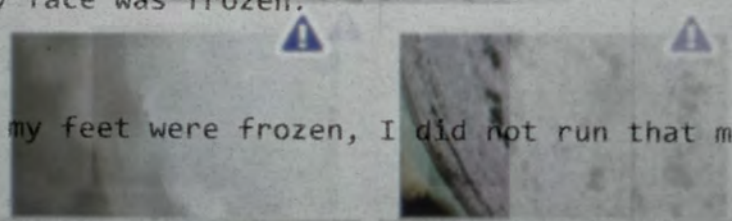


The 3 mm boot is not fit for winter swimming. My feet are frozen. The 5 mm boot is required.



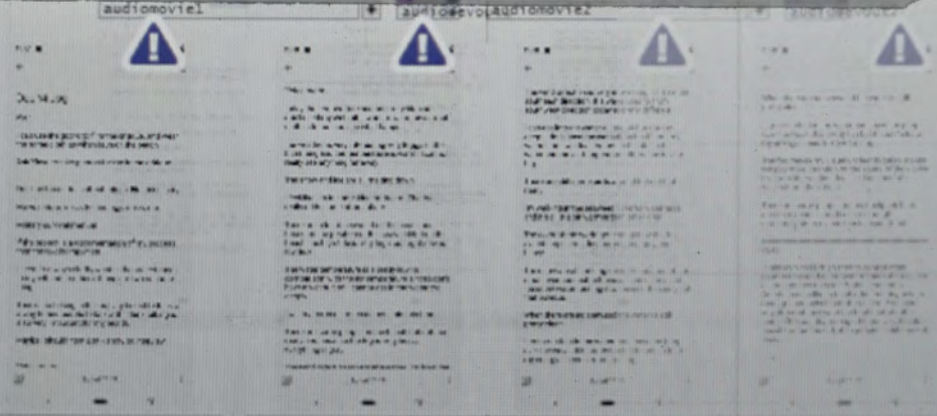
I was facing up and floating backward, and suddenly I got a little too deep in the water. It kind of freaked me out.

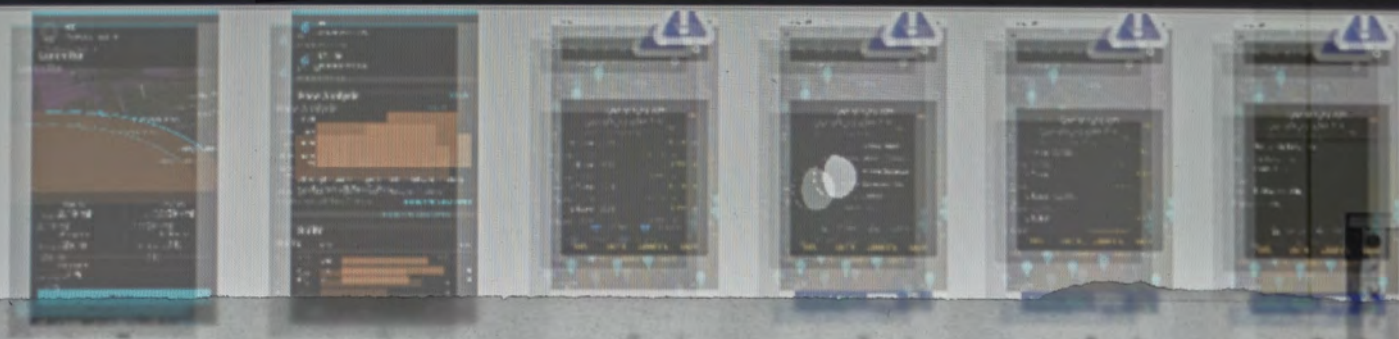
It is not possible to put my face in the water. It is way too cold. My face was frozen.



Because my feet were frozen, I did not run that much

The ocean can hug me. I guess that is why I like to get in the water that much.



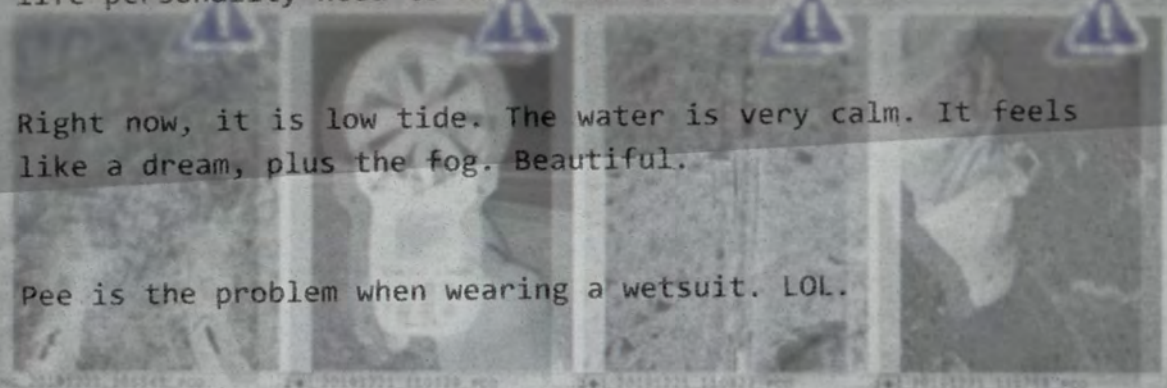


01 04 2020

BLACKPINK[5] members are very badass in their song, but they are cute girls outside of the MV. The contrast makes them interesting. I need to learn from them. My work and my real-life personality need to have some contrast.

Right now, it is low tide. The water is very calm. It feels like a dream, plus the fog. Beautiful.

Pee is the problem when wearing a wetsuit. LOL.



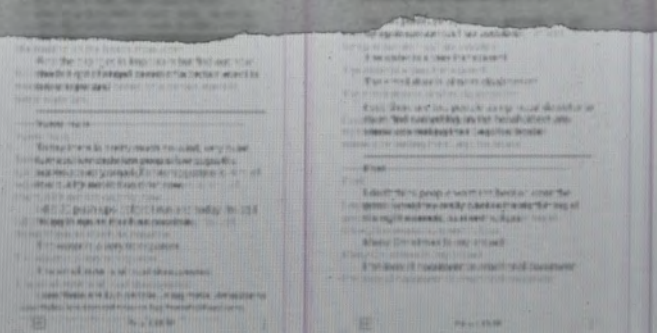
Today there are no waves, so there are also no wave sounds. Everything is so quiet, very chill.

I need to practice swimming more and feel the water.

There are some small newborn birds on the beach looking for food. They are very cute.

---

[5] BLACKPINK is a Korean pop girl group. Their documentary "*BLACKPINK: Light Up the Sky*" can be watched on Netflix.



Operator Quick Intro

Operator H deployed worldwide and conducted various operations. Before Mission *Otter*, he was stationed in China. Due to negative side effects of the operations there, once Stateside he actively worked to monitor and improve his mental health and physical performance. H had a wide range of skills, and his systematic research and development ability helped him quickly adapt to various situations. H's strategies and tactics ensured he could operate under high pressure and harsh circumstances. No matter what happened, he could always bring progress back.

C5

Character Background

H had been through a variety of intensive trainings, both officially and unofficially. The never-settling desire for self-improving was one of his key characteristics. He paid strong attention to mental and physical performance to ensure he could conduct missions at a high level.

During previous deployment in China, he took on countless contracted works with an extremely intensive workload and high kill death rate. It contributed detrimental damage to his health. He gained approximately fifty pounds of weight with several newly occurring health issues. Lack of exercise made him unfit for sport and outdoor activities. His mindset was overly intense and pessimistic. During his RI deployment, H was attempting to recover his health while continuing to execute his mission. He realized if he wanted to take on new missions for the remainder of his life, he must stay healthy. He started to consider health as one of the parameters to measure the success of his missions.

C6

Character Analysis

A professional operator, H counted on missions to make a living. He was continuously evaluating and reflecting on the balance between life and mission work. He sought to integrate missions into his lifestyle, without overworking himself, though they often required all his time and energy. In an ideal scenario, daily life and assigned work should stimulate each other to move H forward in a healthy, sustainable way. However, the ideal scenario was very difficult for him to achieve, as there were many variables. His nationality, financial background, and the battlefield's cruelness all affected the balance between mission and life.

His strength was also his weakness. H's dedication and devotion to the mission forced him to swiftly develop new techniques and experiments, such as the ability to conduct sonic warfare, the capability of operating in air, sea, or on land under any condition, and the real-time situation plus crowd control skill. At the same time, his work ethic caused him to often overlook his health condition, social situation, and financial status. H often worked himself into a hyper-intensive mindset and normalized contingencies, because situations which are considered intense for others might not even reach the threshold of acknowledgement for him.

C7

H was a complex individual dealing with equally complex issues. However, he liked to accomplish simple tasks and often got lost in those situations. He was not only working to execute the mission, but also trying to understand and improve his life. When dealing with such massive operations, all he could do was solve them step by step, tirelessly every day. There were still times he was not sure about whether his actions and strategies were effective, but nevertheless, he always moved forward with courage.

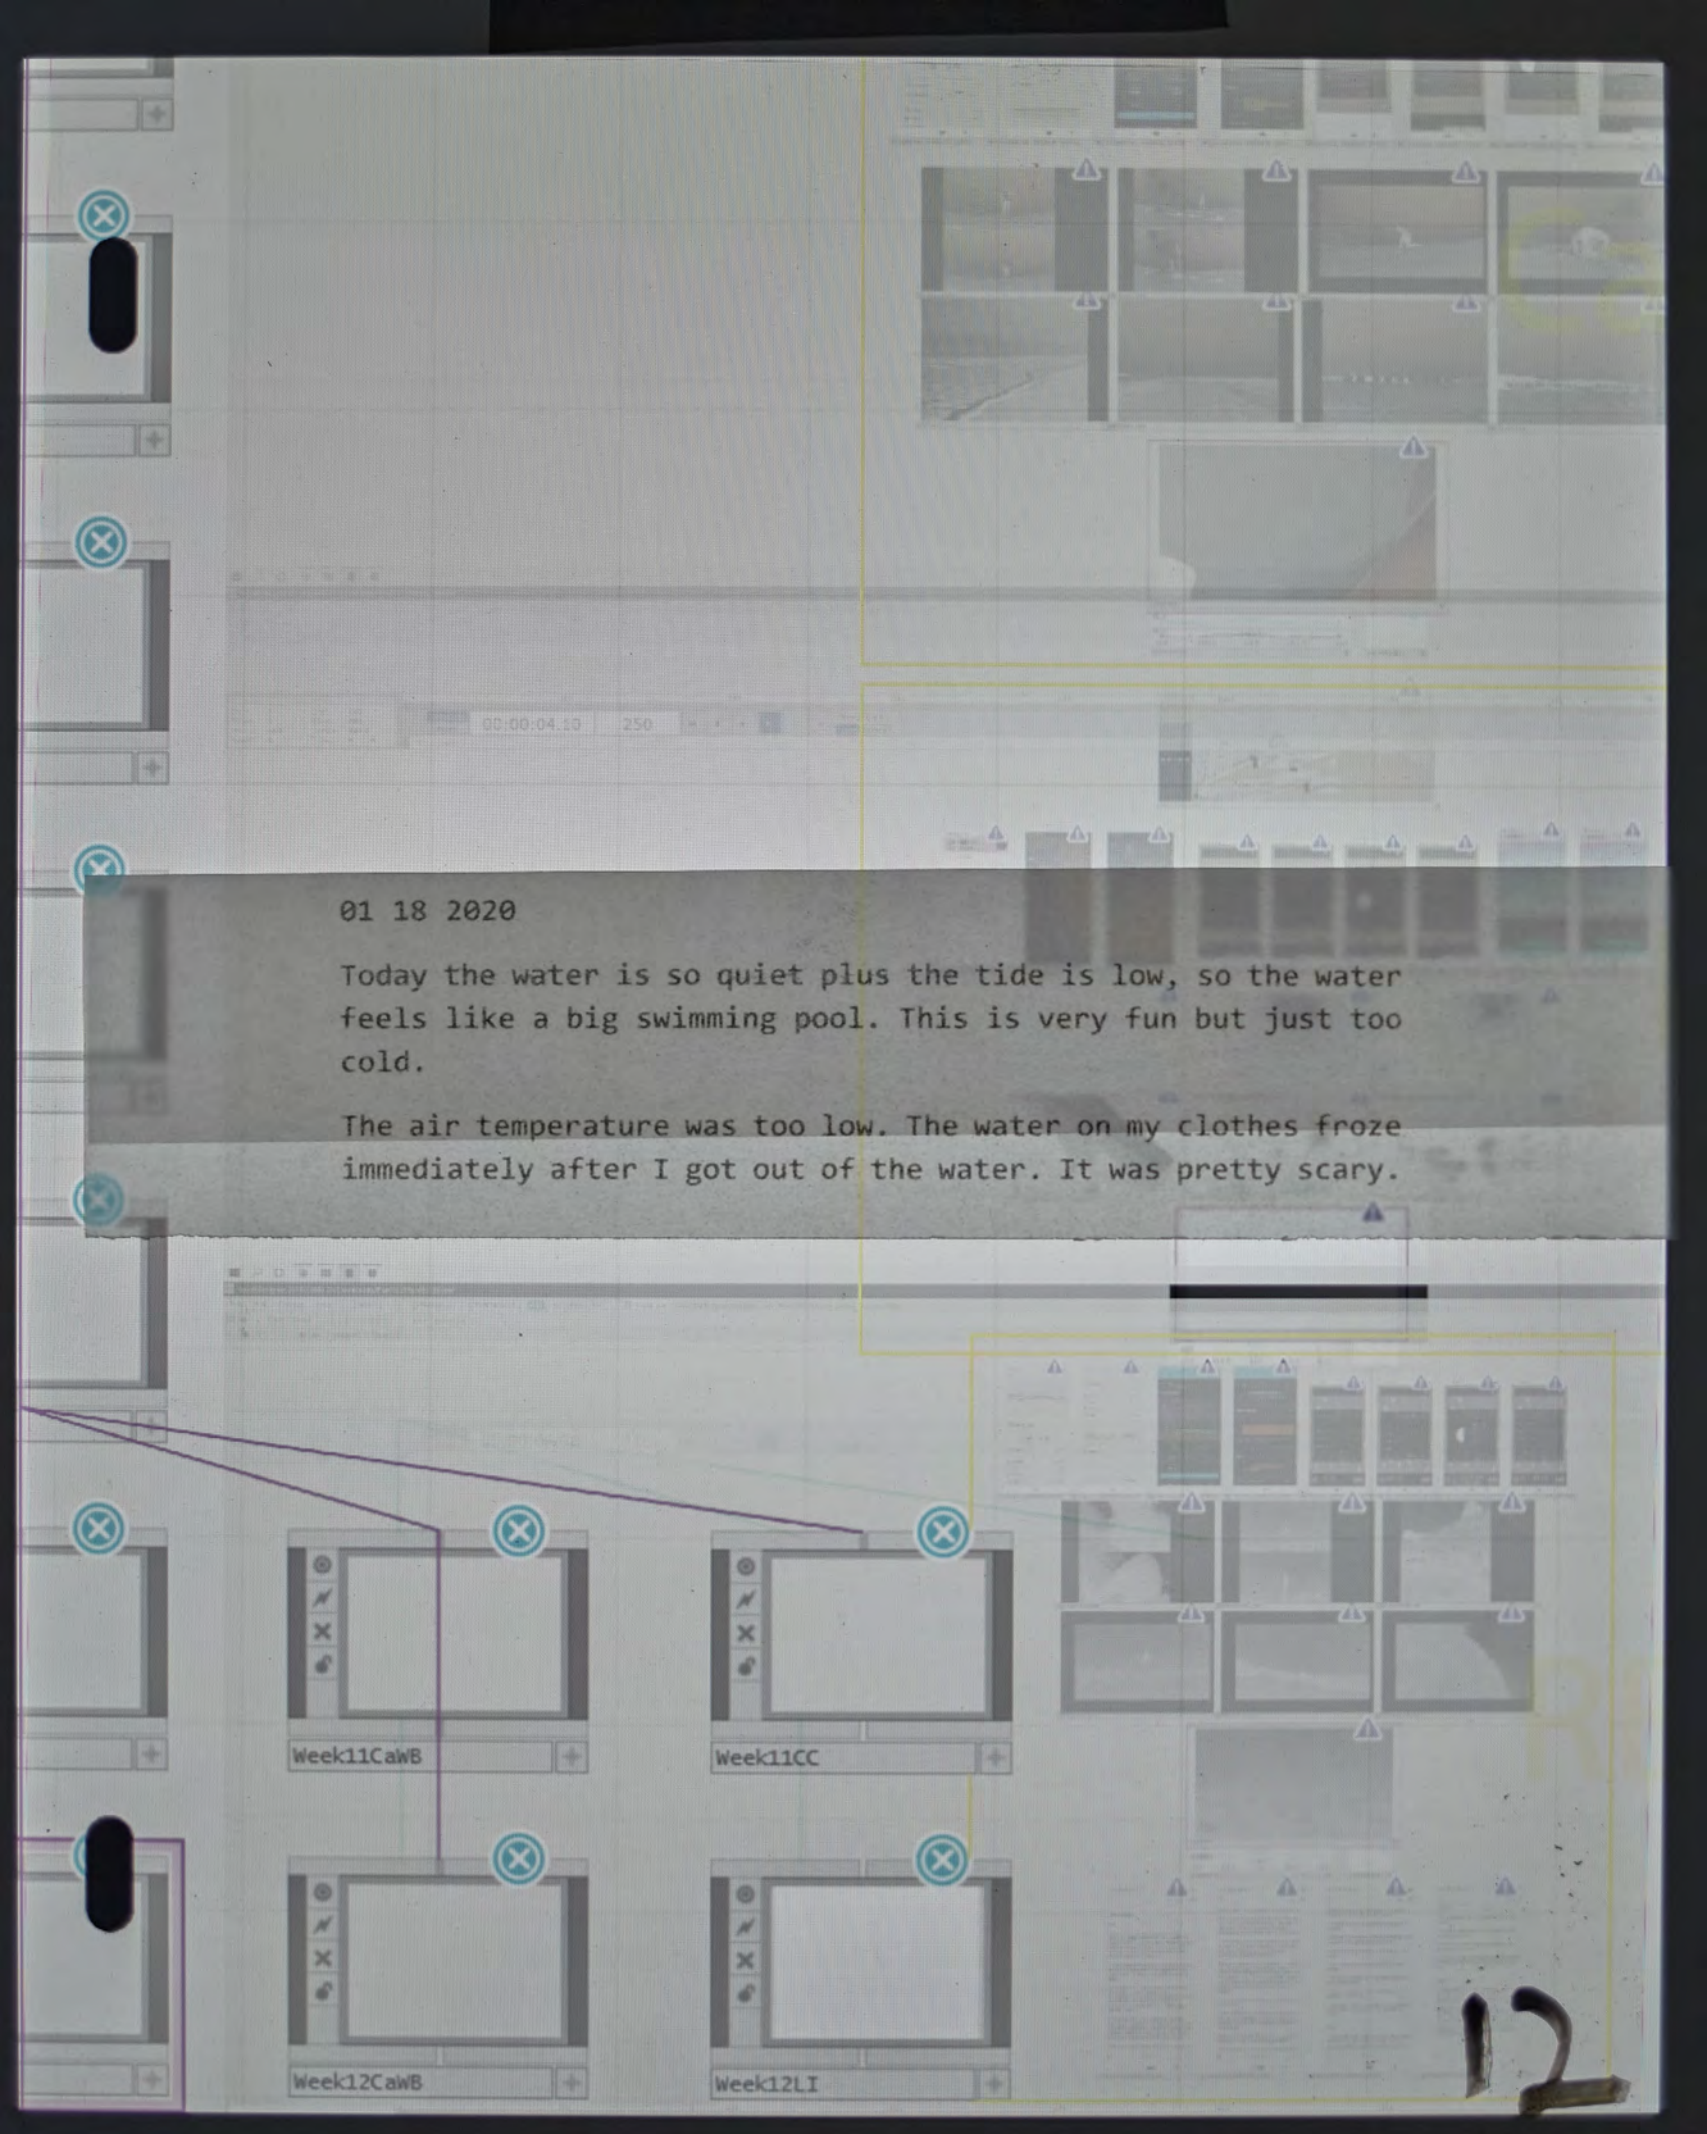
C8

Declassified Mission Log Part 2

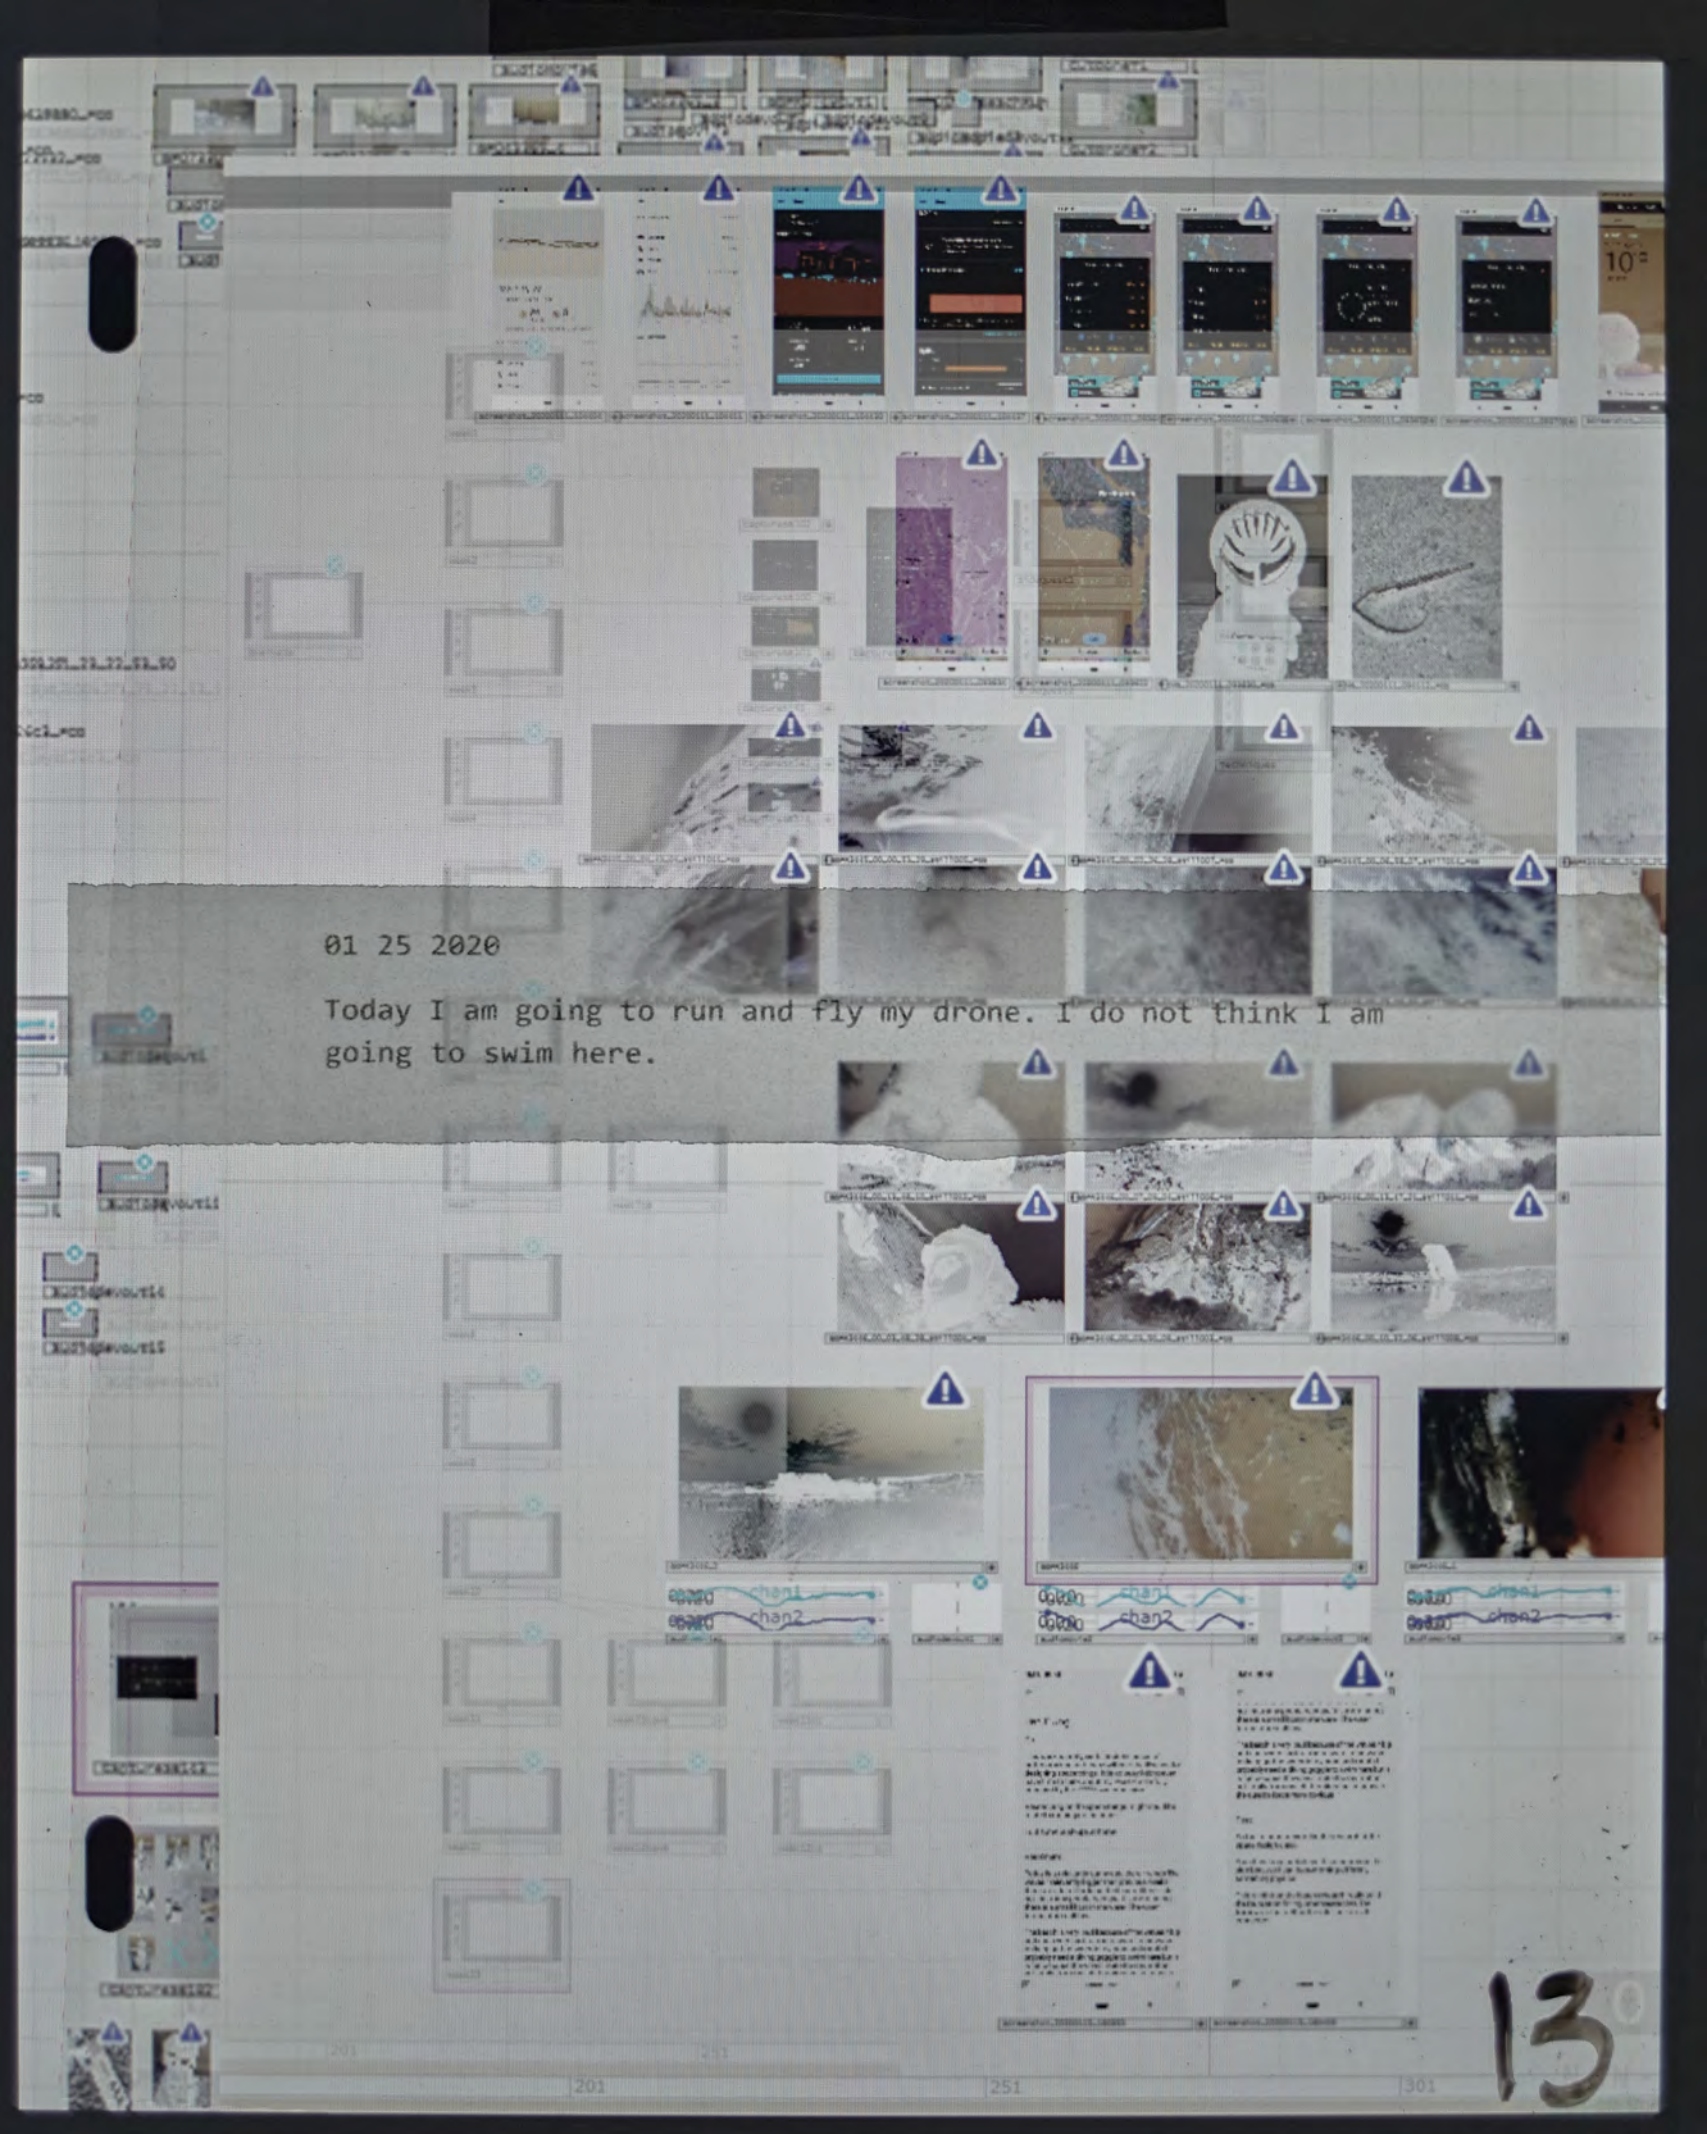
01 11 2020

The beach is very loud because the waves are big. It is very hard for me to swim. I keep getting water in my nose and mouth. I probably need a diving mask to swim here. I think it is fun to let the waves move my body with the water.

This running on the beach research builds the foundation for my other research topics. The framework, the method, and the interface are all connected.



01 18 2020
Today the water is so quiet plus the tide is low, so the water feels like a big swimming pool. This is very fun but just too cold.
The air temperature was too low. The water on my clothes froze immediately after I got out of the water. It was pretty scary.
Week11CaWB
Week11CC
Week12CaWB
Week12LI



01 25 2020
Today I am going to run and fly my drone. I do not think I am going to swim here.
chan1
chan2
13

02 01 2020

Wind speed measurement suddenly has a new significance because the drone can be highly influenced by the wind.

I woke up from a nightmare. I was bleeding in the dream. I felt like my shoulders, chest, and back were bleeding. I got up to check if my body was actually bleeding or not. It was very scary, and kind of interesting. I was so immersed in a different reality. It felt so real.

I am going to fly my drone from the beach to the lighthouse. Hopefully, it is possible.

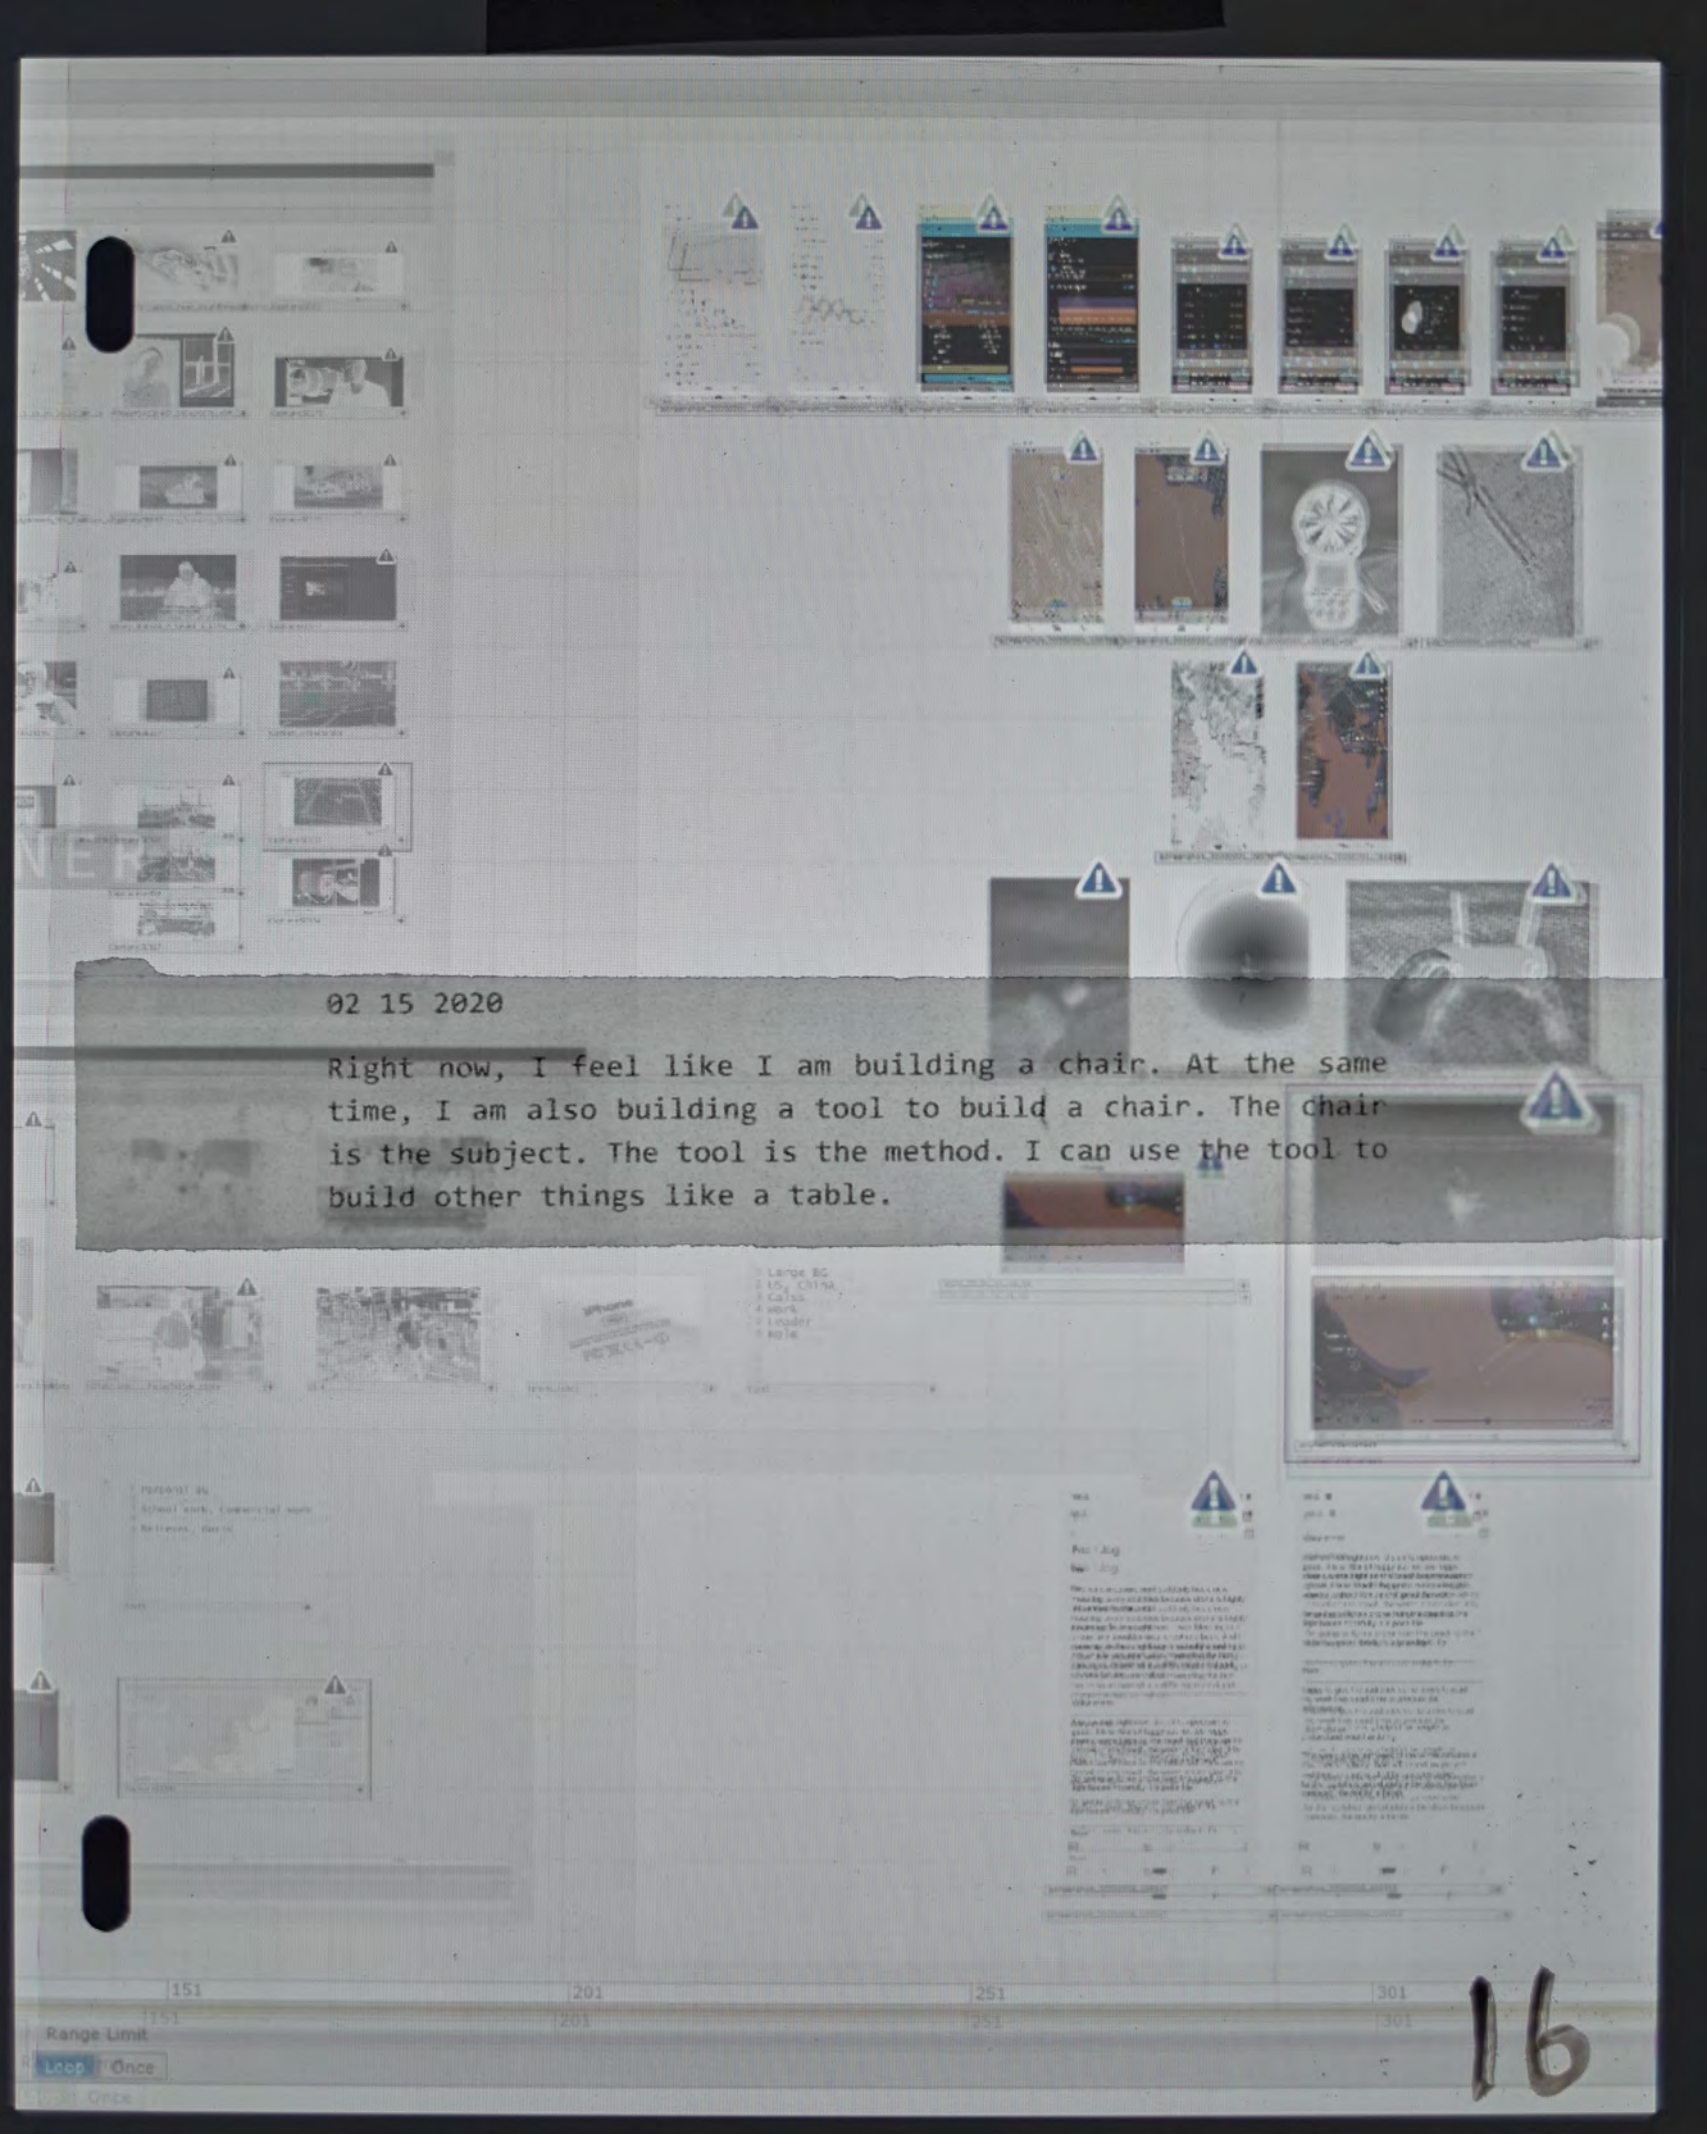
14

02 09 2020

Be a tool man to help everybody? The simulation[6] shows if someone unconditionally helps everybody, eventually, he will die, but if he helps others who can return the favor, then they can grow together. To figure out who to help, one should help everybody once, tag who returns the favor, and then make a selection of people to keep helping.

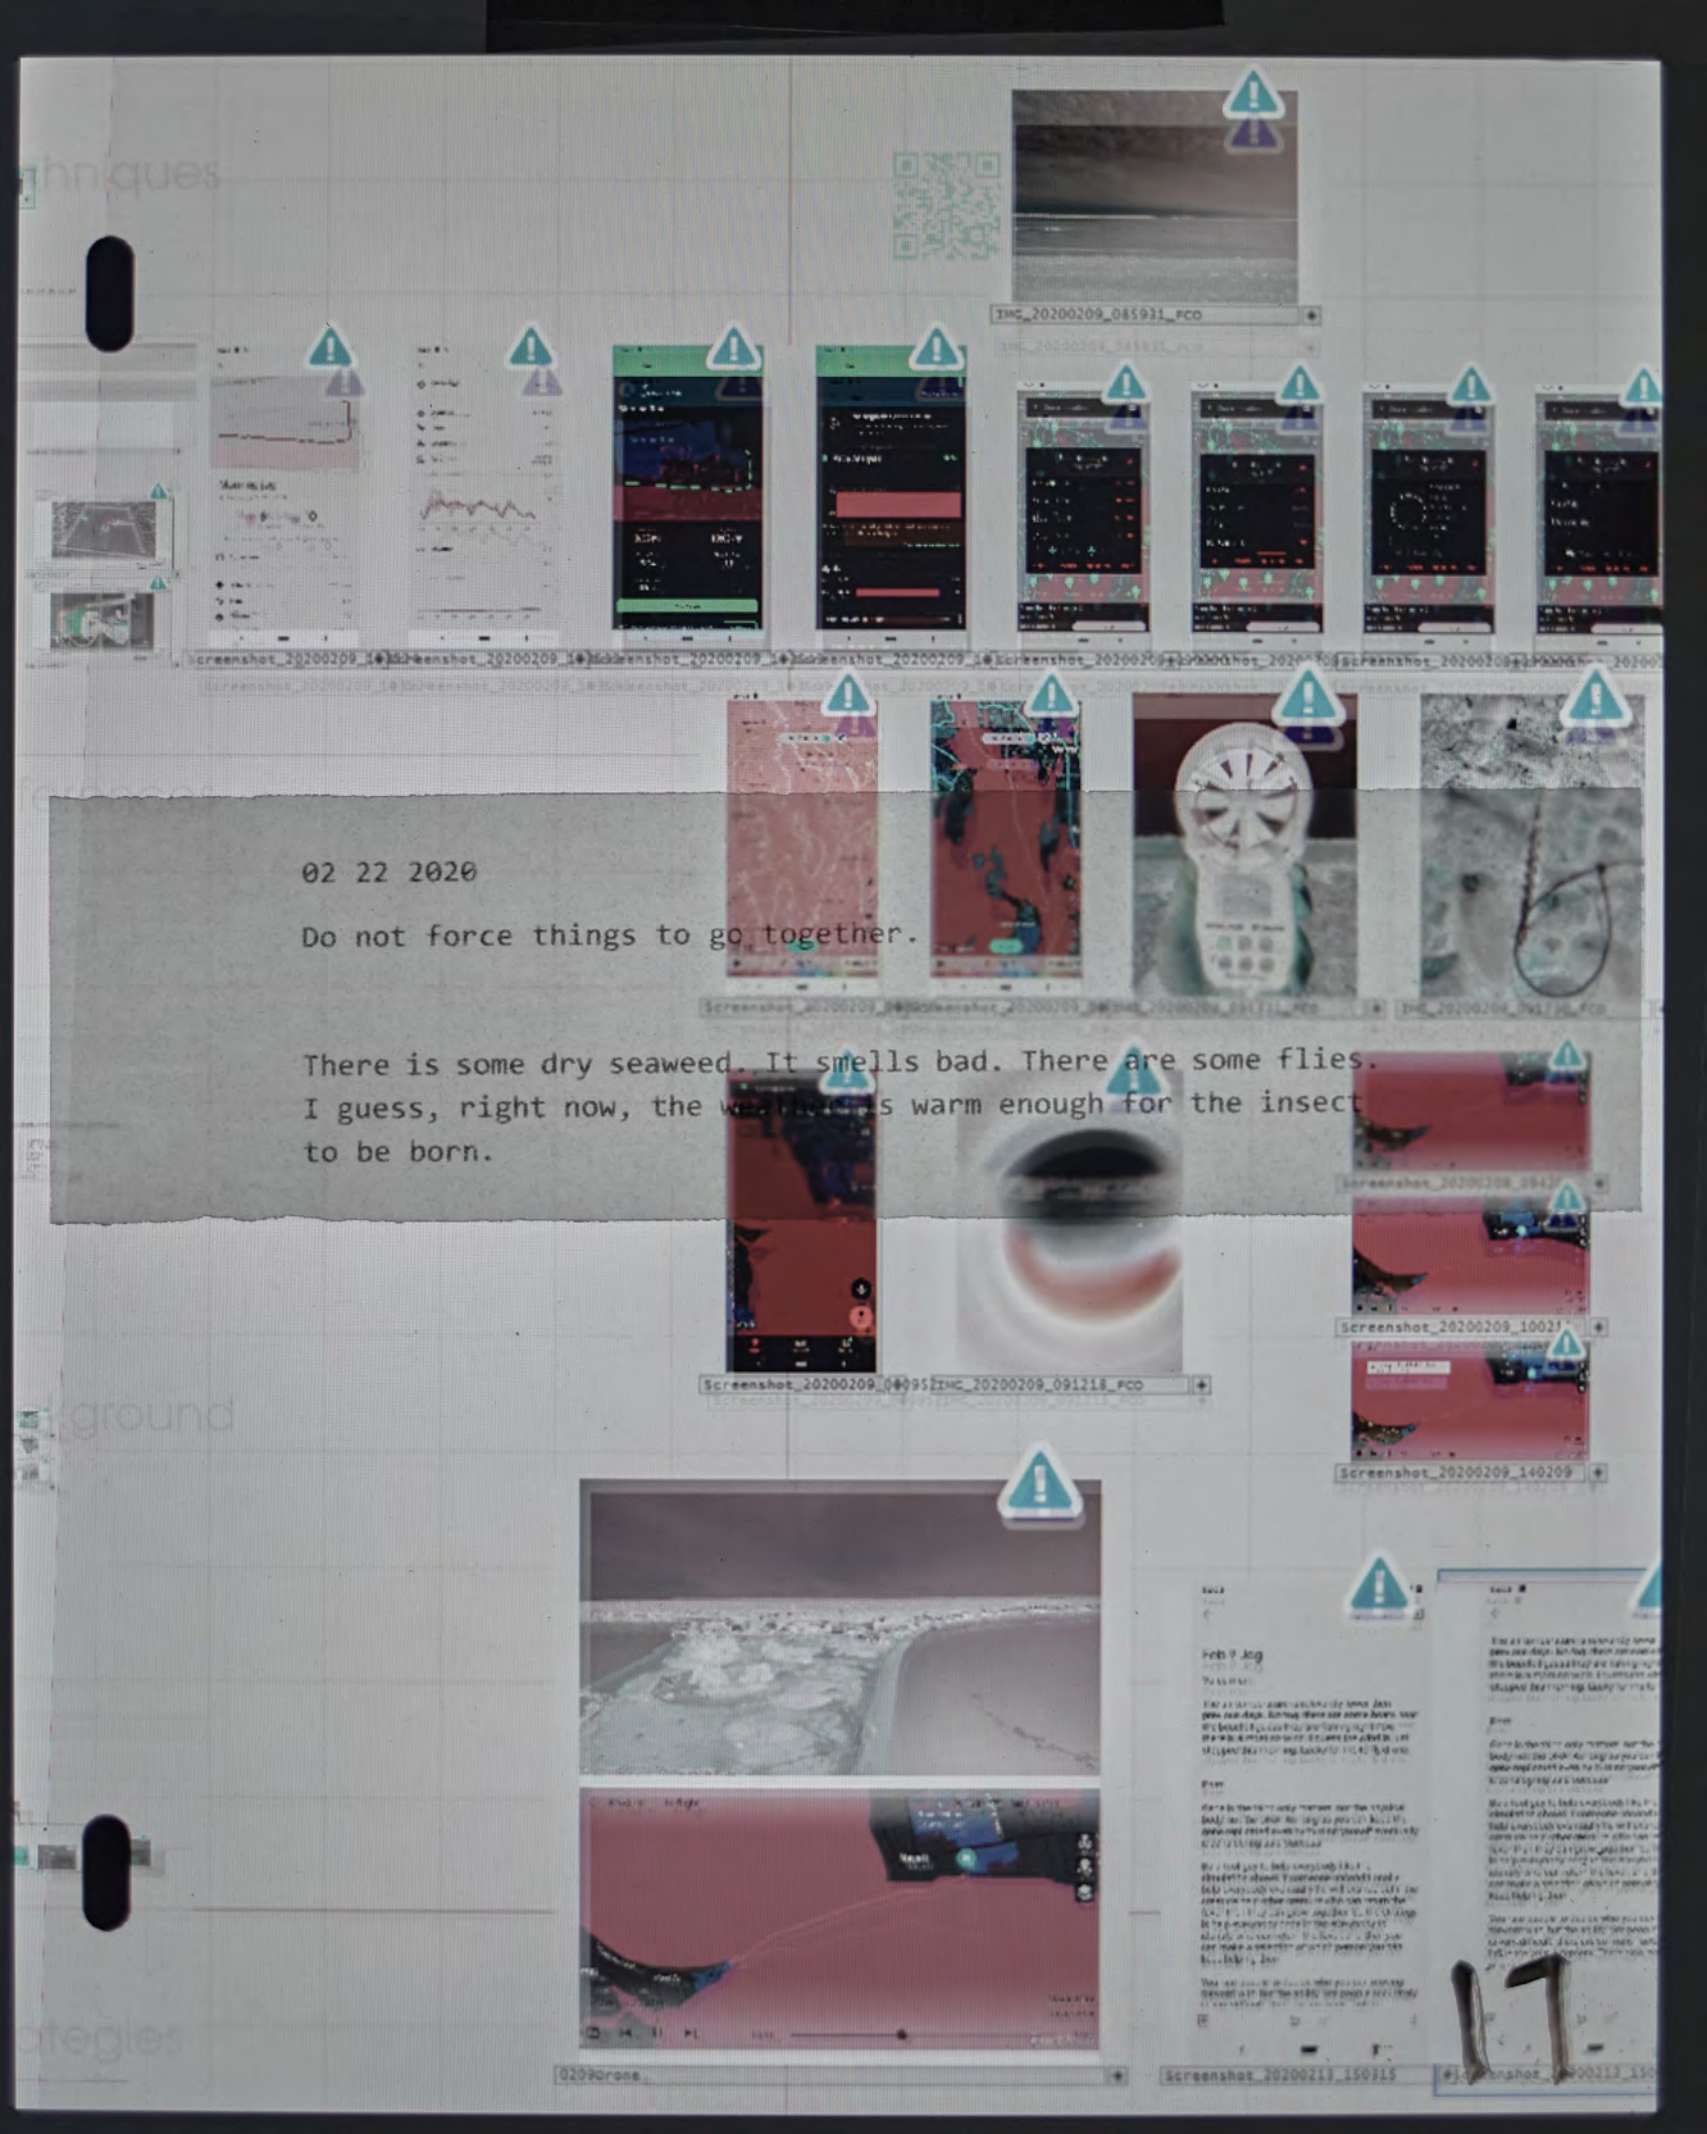
---

[6] Justin Helps, "What's a 'selfish gene'?" Primer, December 16, 2019, video, 5:53, https://youtu.be/2mTVtIoioLg.



02 15 2020

Right now, I feel like I am building a chair. At the same time, I am also building a tool to build a chair. The chair is the subject. The tool is the method. I can use the tool to build other things like a table.



02 22 2020
Do not force things to go together.
There is some dry seaweed. It smells bad. There are some flies.
I guess, right now, the weather is warm enough for the insect
to be born.

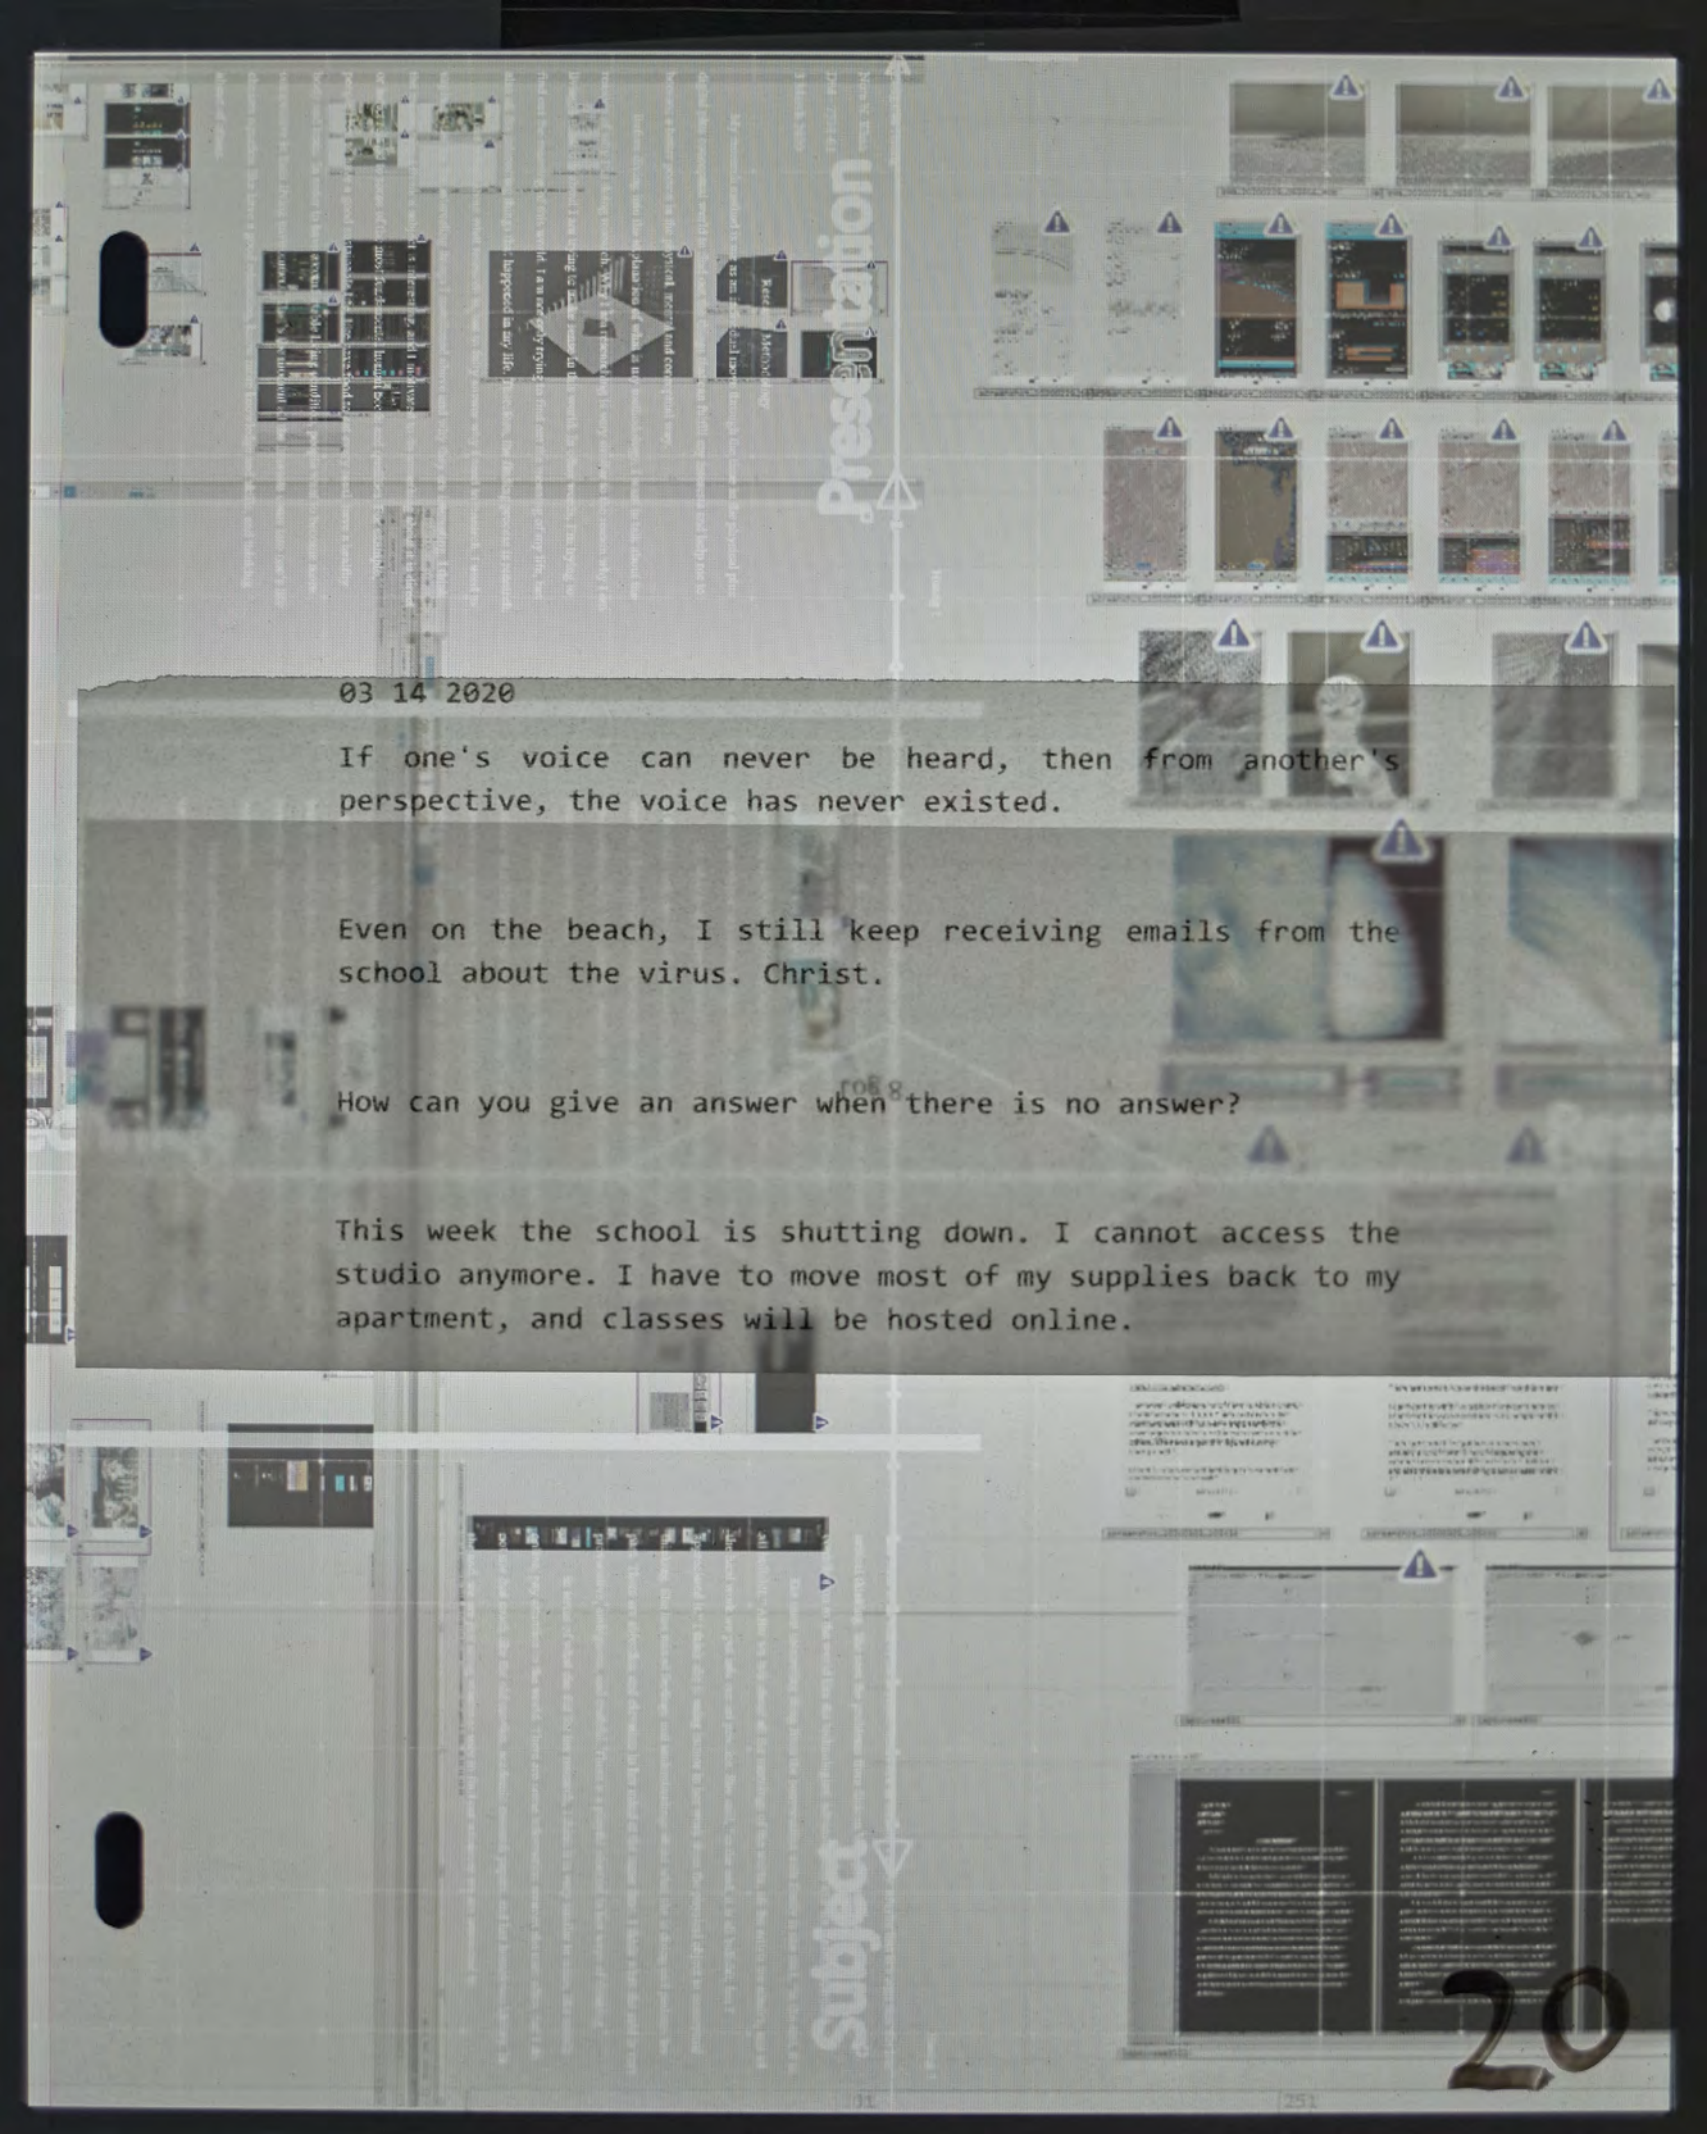
03 07 2020

I do not think I am trying to get anywhere faster or slower, or trying to step on top of something or someone.

Physical, digital, cultural, conceptual, and value.

The thermal 3D scan does not work. The resolution of the thermal images is too low for the 3D scan software. Nevertheless, I generated some meshes from the thermal images even though they did not work as I expected, which is to create the thermal volume of an object.



03 14 2020

If one's voice can never be heard, then from another's perspective, the voice has never existed.

Even on the beach, I still keep receiving emails from the school about the virus. Christ.

How can you give an answer when there is no answer?

This week the school is shutting down. I cannot access the studio anymore. I have to move most of my supplies back to my apartment, and classes will be hosted online.

Operation Overview

Mission *Otter* was initiated to help operative H develop his SOP. It took place in Rhode Island and remained active over a span of two years. During the mission, operator H would access the training field to conduct his SOP and experiments every Saturday morning, while every Tuesday was mission checkpoint. H logged his weekly report, which contained all his development, research, and reflections both from inside and outside the field. He would constantly attempt to improve the efficiency of the SOP. No matter what challenge was in place or how hard the circumstance, the operative must ensure the mission progresses forward. Mission *Otter* was H's last training-oriented mission before returning to the battlefield. All his developments in RI could play the life and death roles in his future.

H chose KBAB, RI as his operation field based on current lifestyle, HQ demand for a weekly progress report, and the desire for self-care and improvement. He possessed an advanced open water diving certificate from a young age, and during the mission, obtained his Unmanned Aircraft System (UAS)[1] pilot license for executing special tasks assigned from HQ,

[1] Unmanned Aircraft System is a term used by the Federal Aviation Administration to define small drones.

C9

such as instructing other operators to fly UAS. When H deployed to RI, his physical condition was well below average. He could not run quickly or for long, and completely forgot how to swim. He was overweight, with low physical performance across the board, due to deployment in China. H developed his SOP to meet the desire for self-improvement and, at the same time, the need to fulfill HQ requirements. One stone, two birds.

C10

Situation Analysis

Mission *Otter* was active from mid-2019 to mid-2021. During this period, several major social events occurred worldwide, including the Hong Kong protest, international trade war, COVID-19 global pandemic, countless racial justice movements, and a tumultuous U.S. presidential election. Such social backdrops challenged the operative throughout the mission, both from mental and physical perspectives. For example, H was forced to adjust his life and operating routine to fit within regulations of COVID-19 lockdowns. He needed to remain mentally positive under the extreme pressure from HQ and isolation. The operator actively equipped himself with a clear understanding of the broader context of the situation while executing the operation.

H needed to recover from his previous deployment to China. Mission *Otter* called for his physical, mental, and social performance needs to be adjusted. He was under HQ's direct supervision. There were ten other operators at HQ, just like him, who were focusing on their own individual missions. Operators worked together and regularly updated mission progress to supervisors. HQ was constantly evaluating all operators' performances and provided mission feedback accordingly. HQ provided a limited amount of hardware to its operators, though in many cases, H needed to purchase and

C11

develop his own personal gear for the mission. Everything he invested in - from a social life and emotional status, to interaction with HQ - were all aimed at achieving a stronger operating performance.

Declassified Mission Log Part 3

03 21 2020

Things are getting very chaotic. There is no food left in the supermarket. Donald Trump called the virus "Chinese virus". It is becoming very dangerous for the Chinese to live in the U.S.

The Forensic Architecture team[7] shows that if I pay attention, with a rigorous research method, to the things that do not seem very meaningful at first glance, I can extract a lot of value from them. Just like if I pay attention to the world, it has a lot to tell me.

There are more people out there than usual. The parks and beaches are packed. Telling people to stay home makes them go out even more.

[7] Forensic Architecture is a research agency, focusing on crime investigations.

EMOTION SCORE

Me: 50 - 10 Near: 50 - 30 Far: 50 - 40

03 28 2020

Even the Forensic Architecture team cannot justify all of the cases they investigated. At least, they reveal their true faces.

Tomorrow, I am going to get to the beach super early to avoid all the people. I will mostly focus on running because I have to work out more than usual. I did not get out of the house for a week, and this is my only opportunity to move around.

Today, I came here at 7:50—very early. The sunrise was beautiful. The light made the other side of the water submerged in gold. There was no wind. The water was very quiet, low tide. The temperature was good, not too cold. The water temperature was still low. There were not too many people. That was good. There were some clouds in the sky, so the sun could not shine on my face directly. I could hear the birds' noise. The water was so calm. It looked like a mirror. The visibility was pretty good. I could see very far away.

The confirmed case number in the U.S. is skyrocketing. It is scary. The U.S. is now the largest contaminated area in the world. This will cause a lot of social issues.

Me: 50 – 20 Near: 50 – 20 Far: 50 – 45

04 04 2020

Your home's window is bigger than my room. Why do we even need to talk?

I have to run very fast and get off the beach very quickly because I parked my car on the side of the street. I am worried that the police will come.

I realized my physical health condition has decreased a lot. I had a hard time catching my breath during the run. I need to do more exercise at home.

There is no time to enjoy the view or to relax on the beach.

I never expected that I would have to avoid getting caught while running on the beach. It is very stressful.

Proxy war[8], proxy art.

04 25 2020

Today I woke up at 5:00, got out at 5:30. It was pretty cold outside. My car windows were all iced.

The water looks like a big green, pink, and orangish mirror, because of the sunrise reflection; very beautiful.

I feel like I can run a little bit faster than last week.

There are some birds making noise. Somehow, this time, I do not feel too annoyed.

Rich, all the problems disappeared; Poor, all the problems appeared.

The idea of betting on someone's future is interesting. Everybody is betting on other people's futures. If people can understand the world and others better, they can make better bets.

People do not like uncertainty. People want to calculate and predict the future to know what will definitely happen, but uncertainty makes things interesting and exciting. Uncertainty can lead to good things too.

The sky is greenish-blue. There is not much reflection on the water.

I can run pretty smoothly for a lap.

The sun shines on my face. I feel great here.

My professors currently want me to externalize my ideas and thoughts for evaluating and reflecting on my work with others. Internalizing those things are also important.

05 09 2020

In my project, there are a lot of parameters. I need to keep most of them as constants and only set a few of them as variables to see the changes.

It is a very cold morning. There are very strong winds and waves.

The birds seem all grown up. They do not look as cute as they did when they were little.

It is calming and pleasing to see my car parked in the parking lot instead of on the street. I do not need to rush back to my car anymore.

I am so glad the state has reopened. I feel like bad things are finished, and people can go back to normal life.

My running ability has improved.

I was shocked after I looked into the Google tracking app. The app tracked me automatically.

My phone knows me better than I do.

There is nothing I can do about this world. I can only improve myself, for example by managing my physical and mental health. The political environment generates this way of thinking. It is a reaction to the circumstance.

Today I woke up at 5:30, got out at 6:00, and arrived at the beach around 6:30.

I can run the entire beach pretty comfortably because the temperature is good and there is no strong wind.

Intercept the power from the side, so I do not need to confront it directly. It is more efficient.

The event timeline can help me to build the relationships between my beach activities and the *Backend Research*.

After I put some events into the timeline, I realize why I think certain things are significant. They are all negative. I could not think of any happy things to put in the timeline. It seems like the media always gives me negative news. I value negative things more.

Everything is covered by grey fog.

I think I use Instagram too much. I keep looking at my posts, not even others' content, just to see them over and over again. I am too sensitive about who viewed my posts. I need to stop.

Mission Objective

After completing Mission *Otter*, H should be fully recovered from the health crisis that occurred during his previous deployment in China. Ideally, he should have a healthy physical and mental condition readied him to take on intensive outdoor activities and a heavy workload. H should have developed a robust SOP for him with which to conduct missions effectively. The mission log he constructed over the two years of active time helped him to reflect upon himself and the world with critical understanding. H was responsible for submitting his mission log to the HQ for evaluation by the end of the RI deployment. This mission was his last non-lethal operation, meaning H had to use the opportunity to do everything possible to strengthen his readiness. The next mission would be even more difficult, with real-world threats and dangers. At this point, H should have improved upon himself from all perspectives; no blind spots were allowed.

C13

Execution Details

H used a weekly development schedule for Mission *Otter*. Every Tuesday, mission checkpoint day, he uploaded the week's log to the Terminal. The progress report contained all mission developments, self-analysis, and writing reflections. Every Saturday, H went to the KBAB training field to conduct a weekly outdoor drill. Before midnight on these days, he uploaded progress of the day to the Terminal, which included documentation of exercises or experiments completed. During the week, H actively built up a *Backend Research* system and sought all opportunities to improve mission performance.

H's KBAB field training consisted of three main components: physical drill, mission experimentation, and data collection. In the field, H ran, swam, and if the weather was suitable for aerial operations, launch a drone to undergo flying exercises. The land, sea, and air drill combo he established helped to engage the physical environment with maximum level of access. Drills were conducted solo-mission style, and there was no break between activities. H carried all equipment needed for the mission, during even running and swimming sessions, in a custom-built dry bag. Equipment optimization and mastery of the gear developed over time. The dry bag also functioned as a floatation device while in the water. A lightweight jacket helped to break the wind while providing

CIA

pockets for smaller equipment. In low temperatures, H wore a compatible wetsuit to help resist the coldness. He carefully selected and planned what gear to equip for each field training session.

H recorded all weather data from field training day, including water and air temperature, wind speed and direction, water and air visibility, precipitation, and cloud states. He used GPS to track running and swimming paths. An always-on action camera mounted on his wrist recorded mission progress and documented environments, as well as logged timestamps with visual or audio backups. In the field, H utilized speech to text on a mobile device to record observations and realizations, which became key elements of mission logs. All collected data accurately depicted activity and conditions for each field training session.

In addition to field training logistics and regulated steps, there existed an experimental component for each session. While H used the field to build new skills, test new concepts, and explore various ways of documenting the training process, he also needed to cultivate one weekly development to upload to the Terminal. This was his opportunity to push himself forward and test mission ability with limited time and

C15

location access. This rigorous pressure endurance ability routine was crucial in staying motivated.

There were many off-field components within the mission, such as the weekly reports, the analysis schema, the self-tracking index system, and the *Backend Research*. The weekly reports carried all the development from that week. H created various analytical schemes to help visualize ideas. These schemes uncovered relationships between instances and his understanding of a situation. He developed indexes for tracking emotion, expectations, and interpersonal relationships. The tracking indexes quantified his personal development and monitored his actions as objectively as possible. He rated himself by comparing his performance to the previous week and adding or subtracting points. Therefore, he could actively adjust his behavior and activity to ensure mission performance.

Backend Research was a system H built to maintain situational awareness and stay updated with emerging technology. All major social events, cultural effects, and memorable encounters outside the field were documented in the *Backend Research*, and allowed him to stay aware of the broader context of the mission.

Declassified Mission Log Part 4

05 30 2020

I need to work on the vibe of my work. Different places and contexts have their vibes. My work is often too serious and dry, so adding some coolness and humor for the public is important, so that I can connect with more audiences.

I think sometimes silence is the most ruthless response.

Swimming is fun. I need to do more. I do not think I need the snorkel. I need a small, waterproofed bag to carry things. The mask is leaking, and I need to go back home to do more testing.

I guess it is necessary to keep up with what is going on in the world, but do not be too distracted by all the news and media. I still have things to do, and the news from Instagram is very biased.

I feel slightly more comfortable about my gesture and breathing this time, in the water. But I still need to improve my swimming skills. I like to float in the water. It feels like being in space, without gravity.

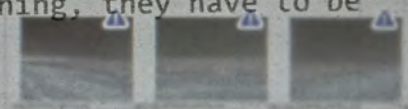
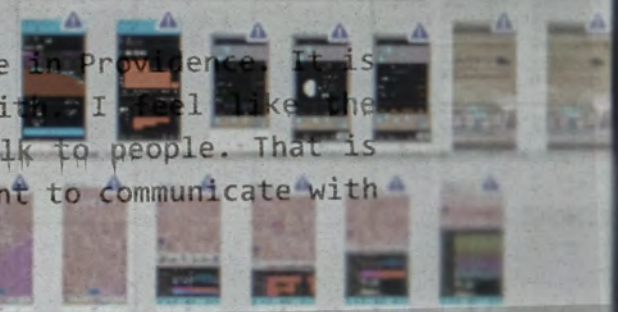
The knife-only play-style in *Call of Duty* shows a high level of commitment. If people try to do something, they have to be all in.

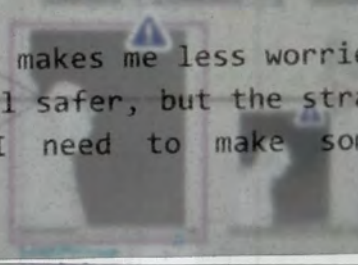


Right now, none of the people I know are in Providence. It is hard to find people to collaborate with. I feel like the quarantine makes me less willing to talk to people. That is something I have to change because I want to communicate with others and look for collaborations.



The beach is very busy—families, children, swimming clubs, and boating people.

The floating bag is pretty helpful. It makes me less worried about going back and also makes me feel safer, but the strap is always tangled with my legs. I need to make some modifications.



Today is actually the first time I looked under the water to see what is there. Because there are no waves, low tide, warm, and my mask works pretty well. There are some seaweeds and small shells in the water, nothing too exciting, no fish.

06 27 2020

I had done less *Backend Research* than when I was in school because I often have larger chunks of time to focus on making things like 3D modeling. In school, I only have small pieces of the time, so I use those times to do *Backend Research*. In school, I did not have the chance to focus on something. The anxiety of the fast-paced study life makes me watch a lot of YouTube videos.

Mental hygiene.

I saw a horseshoe crab when I swam. When I saw it, it stopped, and I kind of freaked out. Later, When I tried to look back to find it, it disappeared.

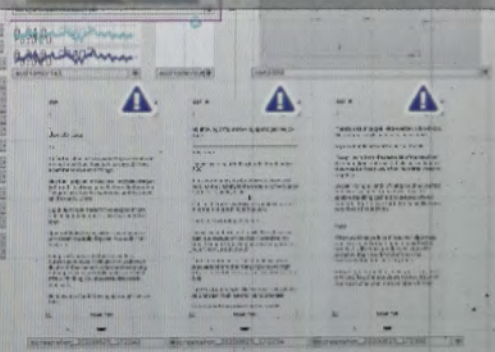
07 04 2020

The operation goes outside. One hour per day to improve my health.

I reduced the weekly report design a lot because I want to decrease the time I spend on it. I will still categorize my *Backend Research* and all the data. But I will spend less time putting them together to present. Fundamentally, I want to reduce my screen time and be less pressured by this routine.

High tide, but when the water is so clear and calm, it makes it feel like low tide.

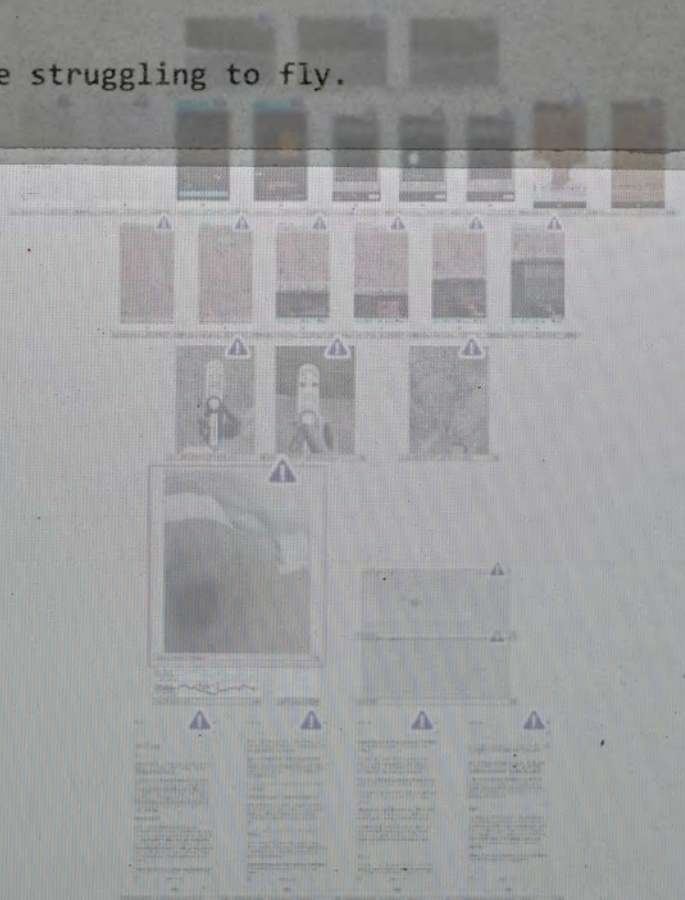
When people try to finesse the process too hard and try to make it super complicated, they might lose the original intention of why they actually want to do it. It could be very dangerous. The balance between the result and the process is important.



07 11 2020

It was very hard to swim this time because of low visibility and big waves. I did not swim very far and stopped many times. I used different swim styles to combat the waves. Pretty fun.

Birds are struggling to fly.



07 18 2020

Love, Death & Robots[9] episode 14 really speaks the truth. When people become so complicated, they start to want to find the initial motivation they had to start everything.

Low impact sports, low impact art.

There is sunshine on the ground. Because of the fog and the humidity of the air, the color of the sky is a very beautiful pink, orange, purple, and nice blue.

---

[9] *Love, Death & Robots* is a science fiction television show on Netflix. The show critically depicts the relationship between humans and technology in the future.

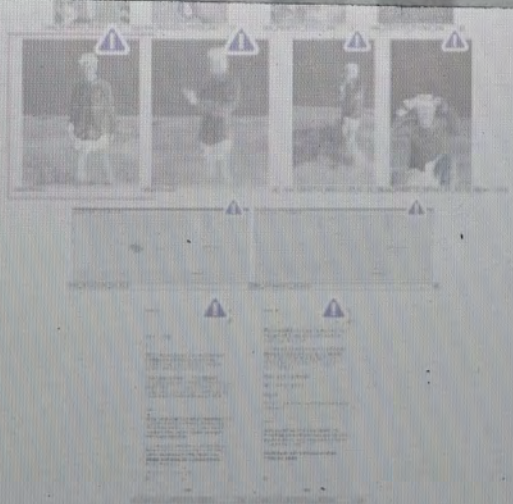
07 25 2020

The sky is mixed with purple, pink, orange, blue, and green, very beautiful. Air visibility is ok. The water visibility is not very good.

Somehow, I feel like the beach becomes rockier. The small rocks hurt my feet, maybe because right now it is low tide.

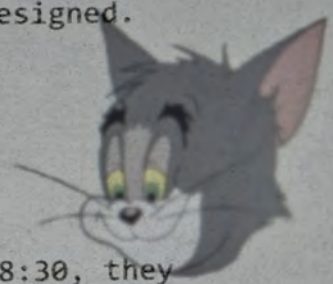
I see a lot of small fish, a lot more than usual.

I feel like the reason I do not feel very calm in the water has something to do with the political situation around me. It makes me more anxious. I am not sure it is the direct reason, but that is my guess.



08 01 2020

You do not have to make people believe it is a good design. You only need to make them think it is carefully designed.



There is a lot of small fish and a few birds.

I just found out that if I go to the beach before 8:30, they will not charge me any parking fee. Somehow, it makes me feel calm.

Today I swam as far as I wanted. I think that is quite an achievement because it was probably the deepest and farthest I have ever swum.

I think in water, the most important things are to stay calm and focused.

Operator Post Analysis

After two years of training, H became fit for outdoor physical missions. At the start of training, H was incapable of running for a quarter-mile. Following two years of training, he could comfortably run over two miles, toting gear, in any weather condition. He progressed from being unable to float to being able to swim in open water for over a mile with a cargo bag in tow. H advanced from having never seen a drone in his life to becoming a certified UAS pilot able to conduct various aerial tasks. He was accustomed to executing missions with no plan, but now had developed a clear SOP to ensure the completion of effective operations.

There were elements within him that had not changed throughout the two-year mission, such as work ethic, the desire to improve himself, and spiritual exploration. With qualities he initially possessed coupled with a proven SOP, skills, and clear-thinking ability developed during Mission *Otter*, H was battlefield ready.

H achieved his goal of undergoing self-improvements that were set at the onset of the mission. After two years of RI deployment, the goal was comprehensively achieved. New possibilities surfaced during deployment that he never knew

C17

he would encounter, such as explorations of sonic warfare training, the study of real-time situation control, and development of field instructor practices. He wanted to accomplish many tasks, and did, but there remained much more to explore in the future.

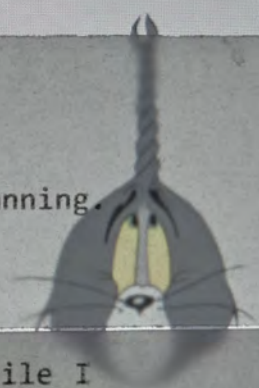
Being an operator is lifelong practice. Taking on one mission after another is what H was driven to do.

C18

Declassified Mission Log Part 5

08 08 2020

I am focusing on human fundamentals, like swimming and running. They are coherent and reflect the current situation.



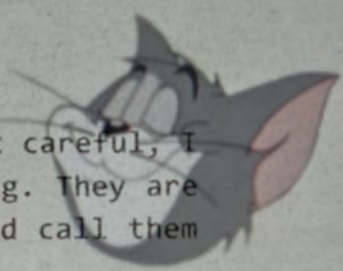
I think the thoughts in my mind are very different while I stay indoors versus outdoor versus digital space. I prefer to go outside more because staying indoors for me is mostly associated with negative thoughts and anger. The same applies to the digital space. It is not good for my physical health to sit in front of the screen for too long.

It is a grey day with no saturated colors. But everything has its chance to have its own color mixed with grey.

08 15 2020

I am editing the previous week's memo on the beach. I think this is the ideal environment for editing.

A beautiful morning on an overcast day. The color is beautiful. Everything's mixed with a little bit of grey.



I see a lot of crabs under the water. If I am not careful, I will probably step on them. They are all very big. They are the marine crab, very interesting. Maybe I should call them dirt crabs.

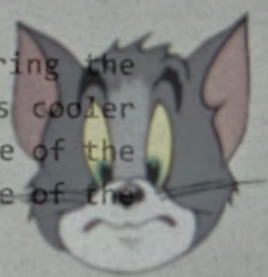
The waves are moving away from the beach, so I have to be very careful about my swimming depth. But the waves are pretty small.

I think digital works are easier to become conceptually focused. Because they can be rapidly produced, and the artist can spend a lot of time thinking about them. The works are often not like some other physical labor-intensive work such as textiles.

08 22 2020

A lot of Americans have been trained to believe the world is supposed to be peaceful and beautiful. Any disruptions should be eliminated. In contrast, people from some other countries think the world is constantly in all kinds of conflicts. Peace is not something very common for them.

Today, I am so tired. My running was good, but during the swimming session, I just felt so tired. The water is cooler than I like, and the water visibility on the west side of the beach is not very good. Surprisingly, on the east side of the beach, the water visibility is very good.



I played *Need for Speed*[10] last night. I guess recently, some people just give me anxiety and sadness. I think I need to expand my social circle a little bit more, rather than stick with a certain group of people.

I think when people do something, they should not be motivated by some kind of superficial pride. That often will not end up with a good result. If people love to do something, they should just do it with their true passion and hard work.

rob ss

[10] *Need for Speed* is a racing video game. In the game, players can experience illegal street racing, car customizing, and open-world driving.

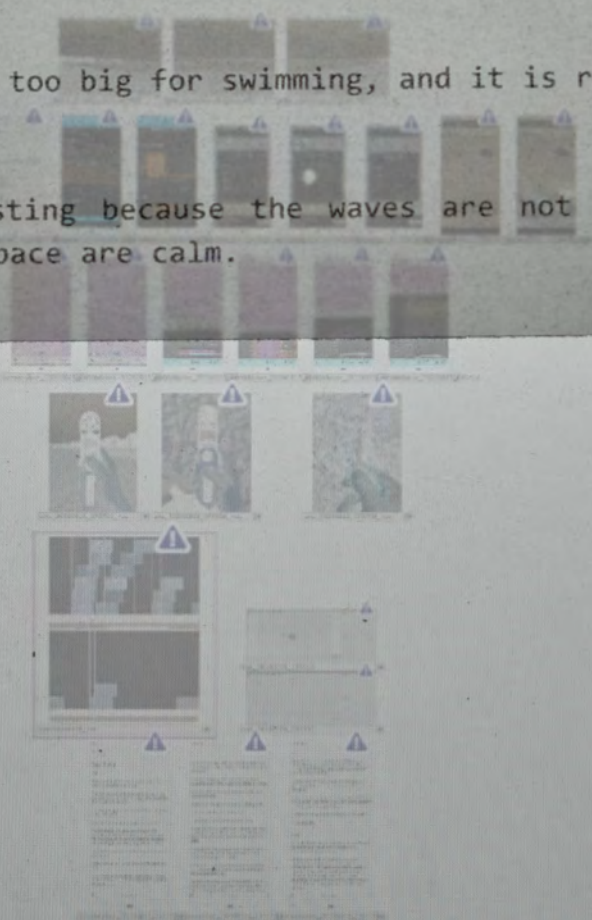
One-way mission. Life is a one-way mission.

Everything is cast in grey.

The waves are too big for swimming, and it is raining.

It is interesting because the waves are not calm, but my emotions and pace are calm.



09 05 2020

I saw the dog again, interesting.

Today my swimming performance is very good. I swam past the second entrance to the public access point. I think this is the furthest I have ever swum.

Maybe the reason my swimming performance is very good today has something to do with finishing my summer documentation. I do not feel pressured to turn in anything.

09 12 2020

The school schedule is pretty insane, very busy. I feel very tired, honestly.

The air and water visibility are very good. Especially the air visibility; it is probably the best I have ever seen.

Sometimes, one thinks something is good for others, but actually, it can kill others.

The drone pilot study actually helped me to stay focused and train my memory. During the summer, my focus and memory become very poor. The test helps me to bring them back to good health again.

Who is going to stay? Who is going to leave? Who do I want to stay, but leaves? Who do I want to leave, but stays?

What if silence is a type of confession?

Because of the wind, I have to cancel my drone plan. There is no way for me to fly the drone with this wind.

Today the swim is very difficult. The waves and the coldness of the water make it hard. My head is frozen.

50

Mission Post Analysis

The operation evolved like a snowball rolling downhill. It began by focusing on fulfilling H's desire of self-improvement balanced with HQ's mission demands, but became a long-term commitment attempting to improve, reflect upon, and present himself in the most comprehensive way possible.

There was no obvious definition of success for the mission, neither from HQ nor H himself. It was not the case that if certain things were accomplished he could call himself successful. He did not need to prove how good he was as an operator to anybody. It was about seeing how much he could do and how much he could improve himself during the two-year mission. The time was limited, but what he could do was not limited. Mission process was more valuable than outcomes for him such as the qualification from the HQ. H walked away with an SOP consisting of strategies, techniques, and unique thinking ability developed during the mission, which follow him to each subsequent mission. That was why he declassified some of his mission logs; they reinforced his understanding of himself. They also could be a reference for other operators.

There were clear benefits to emphasizing operation process over outcome. This conceptual framework removed stress and

C19

anxiety from the operator. Regularly exposed to stressful situations such as the brutal combination of HQ's demands and harmful effects of the COVID-19 pandemic, H used this progress-centered mindset to stay focused, which resulted in more unique and in-depth developments. After Mission *Otter*, all his missions would be lethal-type, in the real-world battlefield with severe consequences to failure. These missions would require him to operate in high-performance mode at all times. There remained no more chances for trial and error or entry-level behavior. Mission *Otter* provided H time to improve and polish readiness for upcoming challenges. It was the last chance to refine his lethality. It was serious.

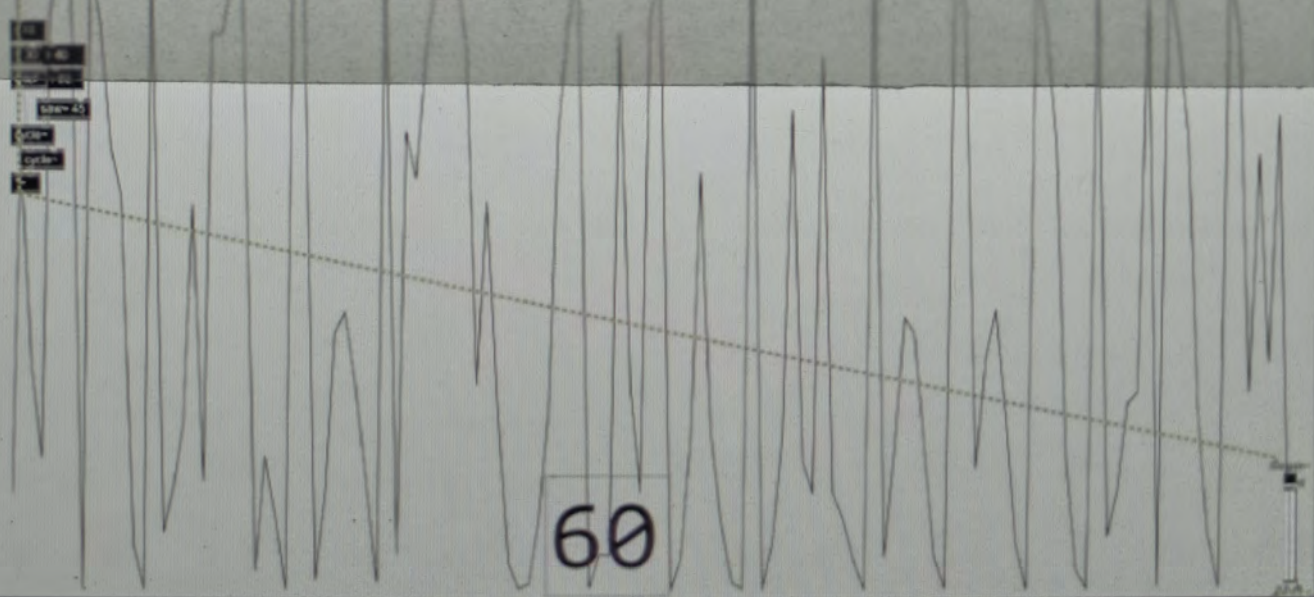
I feel like I am getting busier during the break than the semester. I have more pressure right now because I have to print the book, prepare for teaching, make work, and learn new techniques, very stressful.

The ability to gather people.

The birds are struggling to fly, and I am struggling to run because of the wind.

These birds are really good at hunting fish. There are a lot of dead fish on the beach.



60

Situation Post Analysis

Upon completion of the mission, the global pandemic was still present, especially in the United States. Therefore, more than half of H's RI deployment time was affected. Any mission component involving multiple individuals, such as training tactics, report formats, and joint operation plans, needed to be reconsidered due to restrictions placed on gathering. These constraints eliminated many development possibilities, but they also aided H's solo operating ability and survivability.

The dynamic within HQ and among the rest operators had changed. There were extensive reform and personnel rotation in HQ during the pandemic. Several of H's first-year supervisors had left. During the second year of deployment, H reported to new supervisors, and interaction with other operators became mostly remote. Cyberwarfare became a theme that all the operators must deal with. It was no longer a matter of choice to incorporate a cyber aspect into the mission, because they were already under the cyber impact. Online training replaced in-person sessions. Many mission-related equipment pieces and facilities were placed on limited access, and operators' report styles were switched to virtual focuses.

C21

In contrast with when H began Mission *Otter*, the physical and interpersonal environments became harsher and more unsupportive. This was not completely detrimental because H would soon encounter similar situations in future deployments. The severe context of the mission environment helped to more extensively test his SOP.

Mission Outcomes Reflection

H decided to conduct his mission mostly solo, which was adequate to a certain extent. Would a joint operation style have been more effective? There were a few collaborative side quests during the two-year deployment, but these were not the focus. Would this solo execution-style fit his future missions? In the lethal combat situation, teamwork and the joint operating ability would almost always be required. H neglected the opportunity to build an SOP that oriented to joint operations.

During deployment, H developed a robust SOP for him to execute the mission and improve himself. However, there were no backup plans. No matter how strong the SOP was, there was still the chance for it to fail or become outdated by the time H deployed to new locations. HQ provided an environment to develop freely and without worry of failure. Any change, new discovery, or experiment could be considered progress and improvements, so his SOP would never run into a dead-end. The freedom allowed by the mission guided H to develop comprehensively, staying true to his vision. However, this freedom might have become an excuse to ignore and avoid confronting critical issues like financial limitations and the ranking system. There was no need to switch to a backup plan, and all he needed to do was make the on-going SOP work.

H's strengths could also be his weaknesses. He strictly followed his SOP throughout the mission and hoped for self-improvements. The framework he developed and lived with sometimes could unintentionally cause more stress and further isolate him from the social environment. He was constantly in a highly intensive mindset to maintain his readiness and prepare for incoming contingencies. At the same time, because of this mindset, he could not fully relax and decompress from the stresses. His SOP erased the distinction between his daily life and his mission. All his time was devoted to the mission, but would this be a healthy lifestyle for an operator? The longevity and flexibility of the SOP are questionable.

H lacked both direct and indirect contact with future real-world enemies. The effectiveness, efficiency, and longevity of the SOP and its tactics and strategies were evaluated on a theoretical level. Mockup combat training sessions were designed and required by HQ, but these were just simulations of real-world combat.

C24

Operation Outlook

The SOP H built when he was in RI could become a template for future missions. He would not have to start from ground zero again. It made him more confident in moving on to the next deployment. The ability to construct and execute a successful SOP was more valuable even than the SOP itself. It is crucial for an operator to continuously possess the readiness to adapt to new situations and solve unknown problems. No SOP satisfies all missions, but an operator who can develop new SOPs to fit any new scenario has a higher survival rate. It would be fair to say that the motivation behind H doing all the hard work during the mission was to make sure he could survive.

H did not and should not submerge himself in negative perceptions of the world and his future. However, as a professional operator, he H must prepare for the worst. In facing future missions and battlefields, there are real possibilities of injury and death. All failures and mistakes have the potential to be magnified and cause termination of a mission. For H, executing mission after mission was a lifelong battle, and deployment to RI was just the beginning. It was a mission with no regrets.

It was a life with no regrets.
